METEOROLOGICAL OFFICE

British Rainfall 1962

THE ONE HUNDRED AND SECOND ANNUAL VOLUME

The distribution of precipitation in space and time over Great Britain and Northern Ireland discussed on the basis of observations from about 6,000 stations

Part I	
Divisions used in British Rainfall before 1961	4
Areal grouping of rainfall stations	6
Part II	
Monthly rainfall, percentage of annual average, January to December (12 maps)	9
Seasonal rainfall, percentage of annual average,	
Winter half-year (October 1961–March 1962)	21
Summer half-year (April 1962–September 1962)	22
Twelve months (October 1961–September 1962)	23
Rainfall 1962, percentage of annual average	24
Rainfall 1962, inches and millimetres	25
Graphs illustrating spells of rainfall deficiency and excess, 30 stations	30
Numbers of rainfall days with 0·04 in or more, 0·10 in or more, and 0·40 in or more, seasonal half-years and calendar year (9 maps)	47
Rainfall of 15 January—Wales, north-west England, Scotland	64
11 February—Northern part of England, Scotland	65
2 April—North Wales, northern England	66
16 May—North and north-west Scotland	67
25 July—Essex	67
26 July—South-east England	68
6 August—England, Wales	69
9 September—English Lake District	70
11 September—South Wales	70
29 September—South-west England, Wales	71

LIST OF TABLES, PART II

Table		
	Estimated areal rainfall, monthly, annual and seasonal, for parts of the United Kingdom	
1A	Averages 1916–1950 in inches	4
1B	Values for 1962 in inches	4
1C	Values for 1962, percentage of annual average	4
2	Monthly, annual and seasonal rainfall for individual stations, percentage of annual average	5
3A	Percentage departures of cumulative rainfall	27
3B	Pentad numbers with corresponding dates	29
4	Frequency distributions of daily amounts	42
5	Chronicle of heavy falls on rainfall days	57
6A	Frequency distributions of intense falls	73
6B	Heavy falls in short periods	75
6C	Heavy falls in short periods: Supplementary List	75
7A	Evaporation from standard tanks	77
7B	Rainfall, percolation and inferred evaporation	79
7C	Drainage observations	80

Introduction

The format used in this volume of *British Rainfall* closely follows that first introduced with the volume for 1961. However, in the present volume the data from the standard evaporation tanks, percolation and drainage gauges are included in Part II while the irrigated lysimeter data which have been supplied for several years by F. H. W. Green remain in Part III, an arrangement very reminiscent of that used in *British Rainfall* for the years immediately prior to 1961.

The texts preceding the data in Sections 1 to 7 of Part II of this volume have been reduced to a minimum and the intention is to be equally brief in future volumes. More discursive texts and a longer introduction giving reasons for adopting the current forms of presenting rainfall data are to be found in *British Rainfall* 1961.

River flow measurement stations are included in their appropriate places in the General Table and are indicated by the abbreviation "R.F.M. Sta.". Where available, the 1916–1950 average areal rainfalls over the areas draining down to the R.F.M. stations are given.

For many reasons a number of incomplete rainfall records are received every year. In order to publish the maximum amount of reliable data in the General Table these records are included where at least nine monthly totals are available; totals for the other months, being estimated, are printed in brackets.

Part I General Table of Rainfall

Monthly and annual totals
with amounts and dates of
maximum daily falls

Divisions used in British Rainfall before 1961

Sark		109
Jersey		109

Sub-divisions of river authority areas in England and Wales refer to river board areas in existence until March 1965.

Part of hydrometric area 21(Tweed) and of 77(Esk) are in England but stations within these parts are listed with appropriate stations in Scotland so as to be grouped within the natural drainage area to which they belong.

Part II

Summary tables, maps and graphs with discussion

1 MAIN CHARACTERISTICS OF THE YEAR

General Summary

The year 1962 was remarkable for persistently low temperatures. From March until the end of the year, mean monthly temperatures were below average except during the month of October. Precipitation was not exceptional apart from the heavy snowfall after Christmas which continuing into January 1963 heralded one of the worst cold and snowy spells of the century. The first part of the year was unusually dry with less than 25 per cent of the annual average during the six months February to July in east Devon, Somerset, Gloucestershire, Dorset, Hampshire and Wiltshire. Generally a very wet August and September were followed by a dry October.

Notes on conditions month by month

January. Cold anticyclonic conditions during the first four days, with snow lying 6–8 inches deep over most of the country, then mainly westerly or south-westerly with stormy periods. Weather becoming cold again at the end of the month with easterly winds and snow showers.

February. Changeable and rather mild for the first three weeks with storms and heavy rain between the 11th and 16th. Cold easterly winds with snow showers in the last week.

March. Cold, anticyclonic weather with generally a northerly airstream continuing until the 25th. Precipitation mainly as snow interrupted by a stormy period with heavy rain about the 7th. Warmer during the last week with west to north-westerly winds and showers. Widespread heavy rain on the 26th and 27th. The coldest March of the century.

April. Cold and dull in the south-east; sunny in the north-west. Some very heavy rain in the west on the 2nd of the month.

May. Mainly unsettled from the 3rd to 22nd, with heavy rainfall in the west from about the 5th to the 9th; especially heavy again on the 13th.

June. Sunny and dry, but cool. Anticyclonic at the beginning and towards the end of the month but subject to a series of rather weak frontal rains from the 9th to the 25th. Almost rainless over much of southern England.

July. Continuing mainly anticyclonic and fine during the early part of the month, but weak depressions and ridges crossing the country from the 9th to 26th. Local thundery rains on the 9th, 10th, 11th, 25th and 26th.

August. Mainly cyclonic, cool and wet with a series of troughs moving over the country, but with brief anticyclonic intervals on the 12th and 13th and on the 30th and 31st. Widespread thundery rains on the 15th and 16th.

September. Mainly unsettled weather during the first two weeks. Anticyclonic conditions from the 18th to 24th. Very wet on the 9th, 11th and 29th.

October. Warm, dry and anticyclonic until the 24th. Changeable and wet for the remainder of the month.

November. Mild at first then cold with frequent snow showers from the 16th to 23rd.

December. Foggy and cold at first followed by changeable weather during the second and third weeks. Very cold with heavy snowfalls in the last week.

Details of heavy falls on individual occasions are given in Sections 5 and 6 of Part II.

2 MONTHLY, ANNUAL AND SEASONAL RAINFALL

This section presents, for a selection of stations, tabulated data expressed as a percentage of average annual rainfall for the standard period 1916–1950. Similarly, a series of monthly, annual and seasonal equipercental maps is given. Maps in this form were first introduced in *British Rainfall* 1961.

The monthly and seasonal maps are based on the records of a rather limited number of stations (about 550) and consequently give a broad and somewhat simplified picture of the equipercental distribution of rainfall. The annual map, however, is based on all the reliable data available and therefore is much more detailed, so much so that a few minor features too small to reproduce clearly in this publication have had to be suppressed. This map supersedes earlier versions based on less abundant data.

For the purpose of comparisons, maps of monthly and of seasonal average rainfall expressed as a percentage of standard period annual average are to be published in the *British Rainfall Supplement* 1961–1965. Monthly equipercental maps—average monthly (1916–1950) rainfall expressed as a percentage of the average annual rainfall—are available in booklet No 2A issued in conjunction with the map of average annual rainfall for 1916–1950, published by the Ordnance Survey in the Ministry of Housing and Local Government planning series.

Included in this section is a map showing total rainfall for the calendar year expressed in absolute measure (inches with millimetre equivalents) which is identical with that published in the *Monthly Weather Report Annual Summary*; the monthly maps in absolute measure are published in the *Monthly Weather Report*.

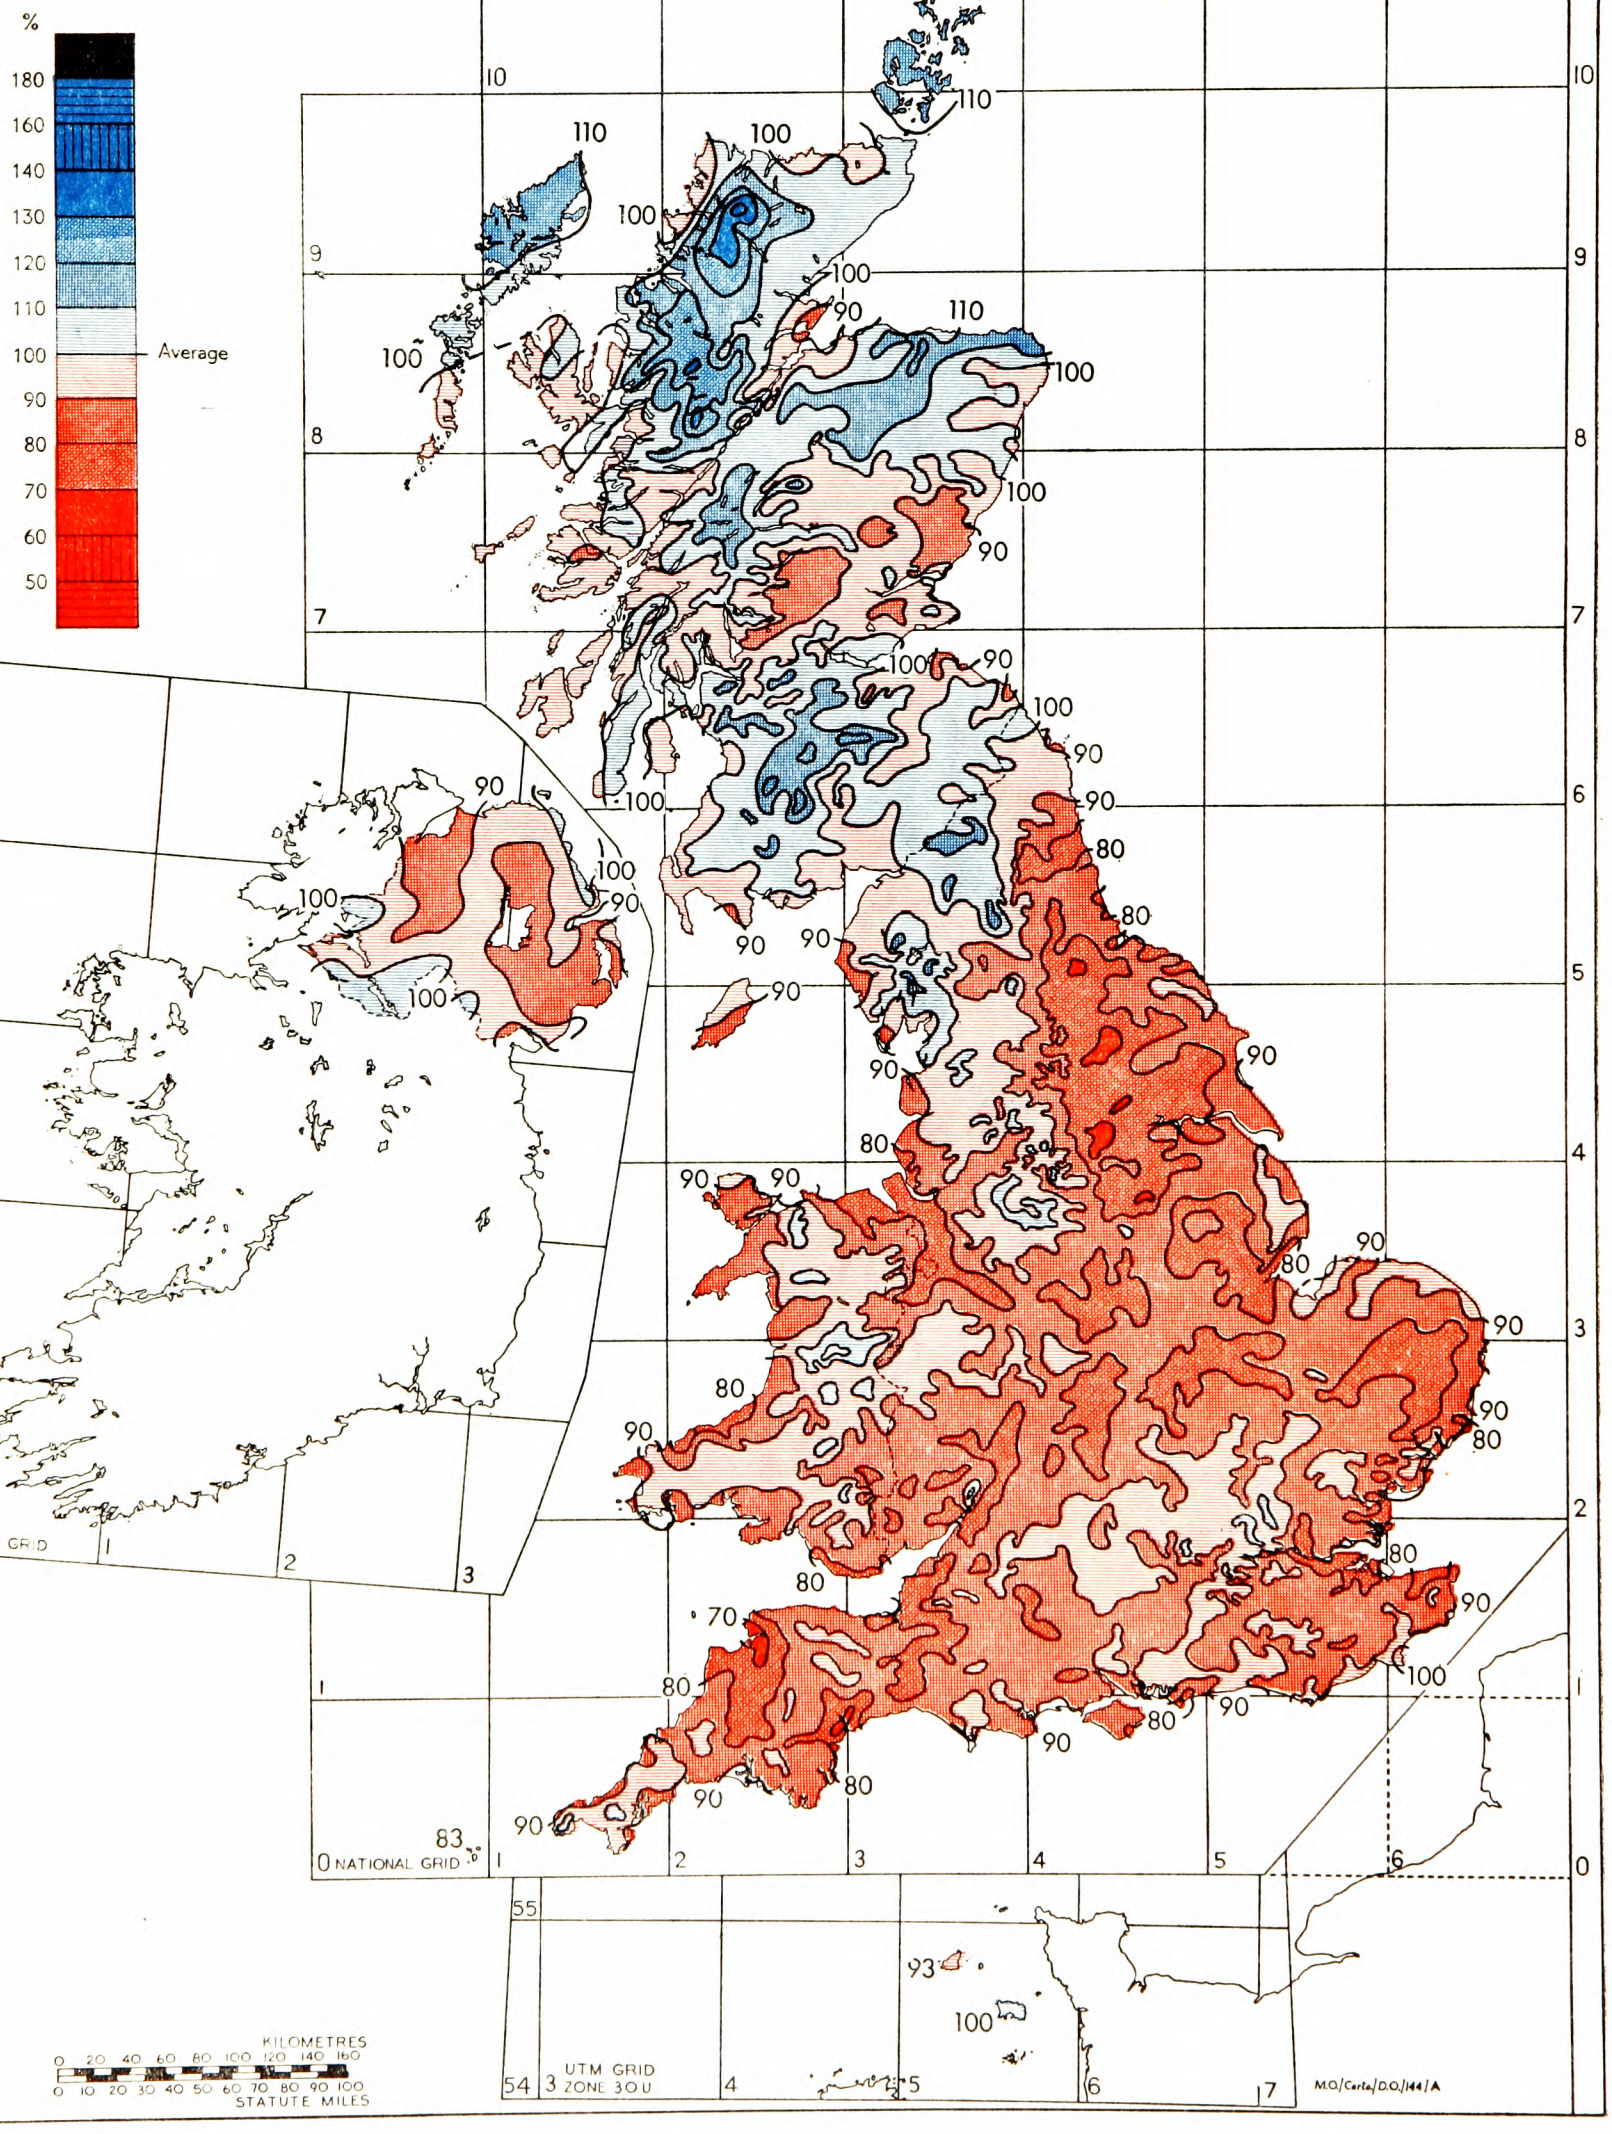
RAINFALL

1962

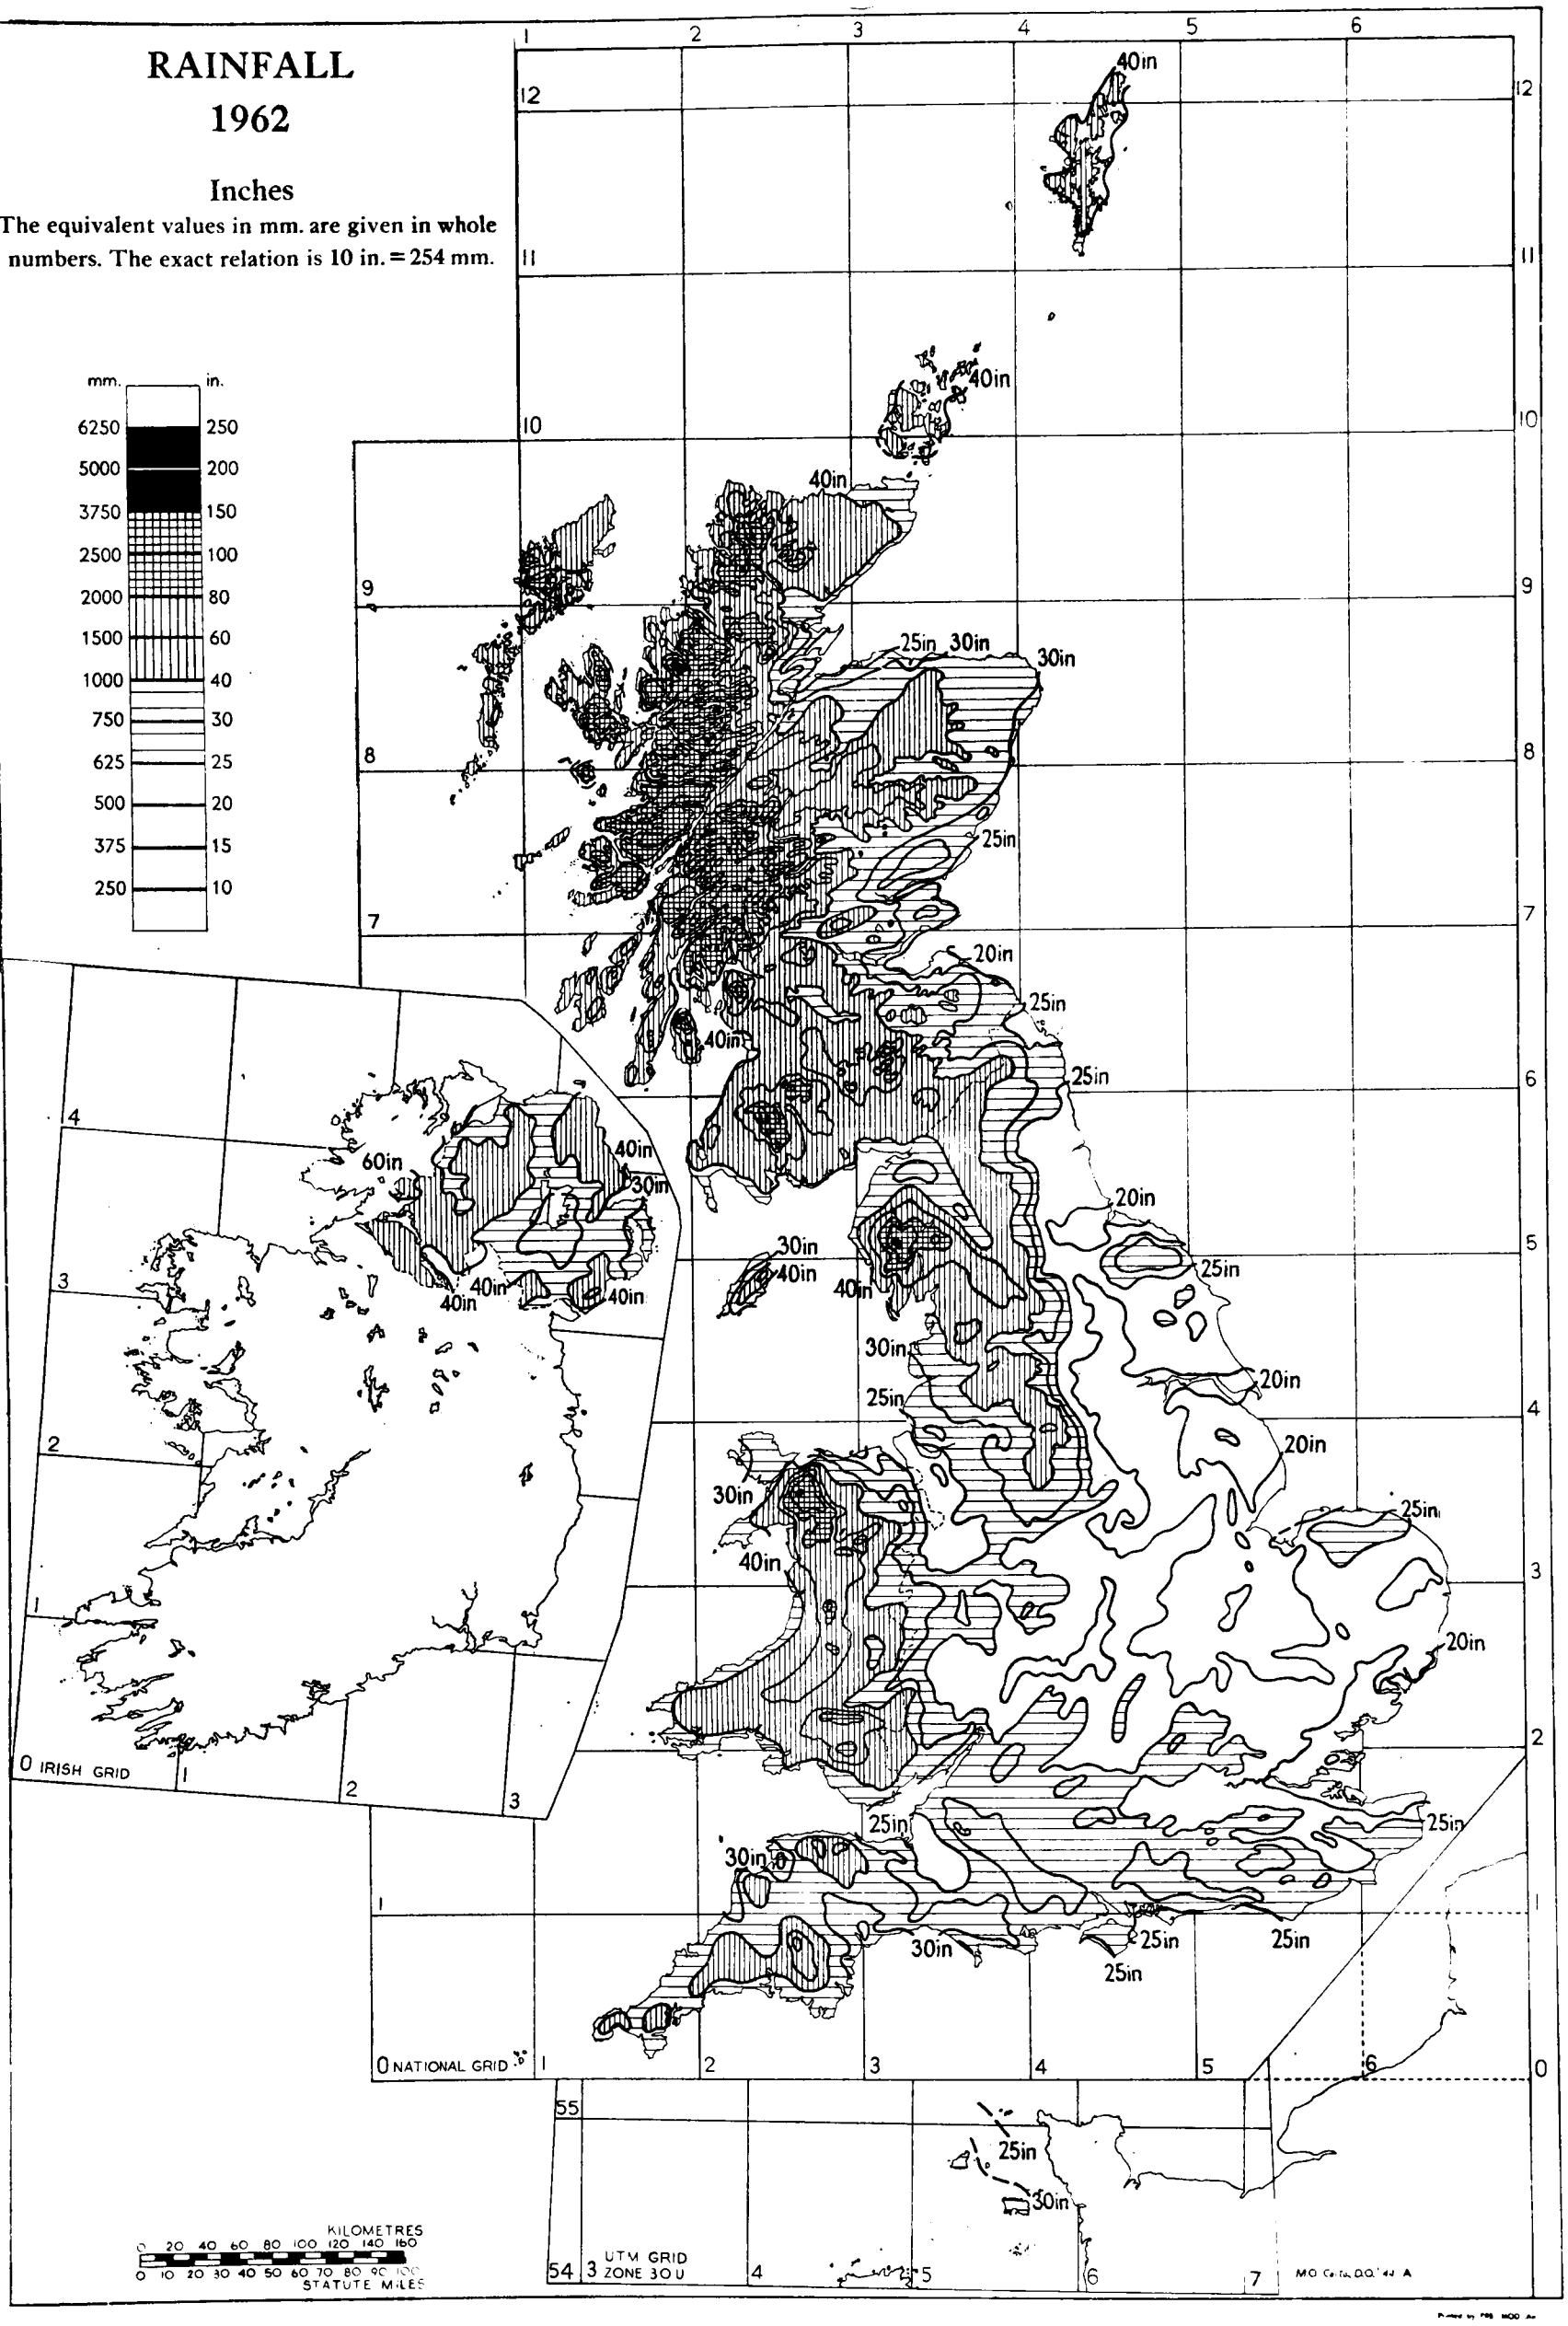
Percentage of annual average for the years 1916-1950



RAINFALL
1962

Inches

The equivalent values in mm. are given in whole numbers. The exact relation is 10 in. = 254 mm.



3 SPELLS OF RAINFALL DEFICIENCY AND EXCESS

The reasons why tabulations of occurrences of drought and dry spells, or wet spells and rain spells based, prior to 1961, on a set of arbitrary criteria are considered unsatisfactory have been discussed in *British Rainfall* 1961. Accordingly, a method was introduced for examining spells of rainfall deficiency and excess without dependence on fixed or arbitrary definitions.

It is hoped that the current method will lead to interesting and useful developments. For any station, cumulative amounts of rainfall at intervals throughout the year are first expressed as percentages of average annual rainfall, and then as departures from the percentage amounts which would accumulate at a uniform rate corresponding to the average. The results may be conveniently plotted at five-day intervals (pentads) as in the graphs which follow. Beside each map is included relevant details of rainfall during the year.

Approximately horizontal sections in these graphs correspond to rainfall at more or less the average rate for the station. Significantly descending sections represent rainfall deficiency spells, with a limiting slope corresponding to no rain at all. Ascending sections, for which there is no accurately assignable limiting slope, represent periods of excess; during thundery spells, particularly in low average rainfall areas, the rise from one point to the next may be very steep. The zero line is arbitrary and a new start may be made at any point in the year by an appropriate zero shift without any change in the shape of the curve. Graphs for successive years may be joined together by simply joining the curves, with any appropriate adjustments of zero lines.

Used either singly or, if required, in combination, graphs of this type can help to overcome very largely some of the disadvantages of working constantly with the conventional divisions of the year into months and seasons. Though it is convenient and in some ways necessary to use these divisions, far more often than not it turns out that there is a meteorologically arbitrary element about the point of separation of one such period from another. In arranging the material given in the table and maps of Section 2, in particular, it is almost impossible to avoid imparting to individual months and seasons quite separate meteorological identities which in fact they rarely possess. The graphs provide a useful way of showing how the characteristics dominant at the end of one month or season often run on into the next. A sufficient body of data analysed on these lines would indicate when decisive changes most frequently occur, and would probably help, for instance, to determine whether there is any specially advantageous month to be chosen as the beginning of that "seasonal year" which would be most meaningful in relation to rainfall and perhaps also evaporation and other elements in the hydrological cycle.

In fact the most serious weakness of this form of presentation as introduced here is that it refers to percentage rainfall in isolation. This is convenient for studies restricted to rainfall alone as it reduces to a common basis the low average rainfall and high average rainfall stations. For some purposes concerned with actual quantities of water, rather than variations relative to average, it would be better to express rainfall in absolute measure and adopt some form of combined presentation with other elements, notably evaporation. This matter is receiving attention as a probable development for the future.

A minor objection to this form of presentation is that when there is any degree of regular seasonal variation of rainfall underlying more random irregularities, the graph for any individual year should be taken in conjunction with the corresponding curve for average rainfall through the year. The average curve will certainly be very much flatter than the separate graphs for almost all individual years, but will not usually offer a really close approximation to a horizontal straight line. The preparation of average curves is being undertaken and a selection is to be published in the *British Rainfall Supplement* 1961–1965.

The data for 30 stations are set out in Table 3A with the pentad numbers in the first column arranged for ready reference in Table 3B. The corresponding graphs for these stations are given in the same order on pages 30 to 39. Heading the details given on the right-hand side of each graph is the station name followed on the next line by the appropriate river authority and the drainage area. Some of the details give information additional to that shown in Table 3A and in the graphs themselves since the rainfall amounts for individual days within the pentads have been taken into consideration where appropriate, so as to determine the full extent in days of any spell worthy of note.

In 1962 the deficiency slopes are of greater interest than the more broken excess slopes. There were no excessively wet periods worth mentioning. Generally there was a deficiency trend from about the 5th-9th to about the 41st-44th pentads but in places in the south-west, west and north the tendency continued until about the 68th-72nd pentads.

The year as a whole was near to the average as is demonstrated, particularly clearly, in the graph for Wick. Two outstanding dry periods were from the end of May to the 9th July and from about the 1st to the 24th of October.

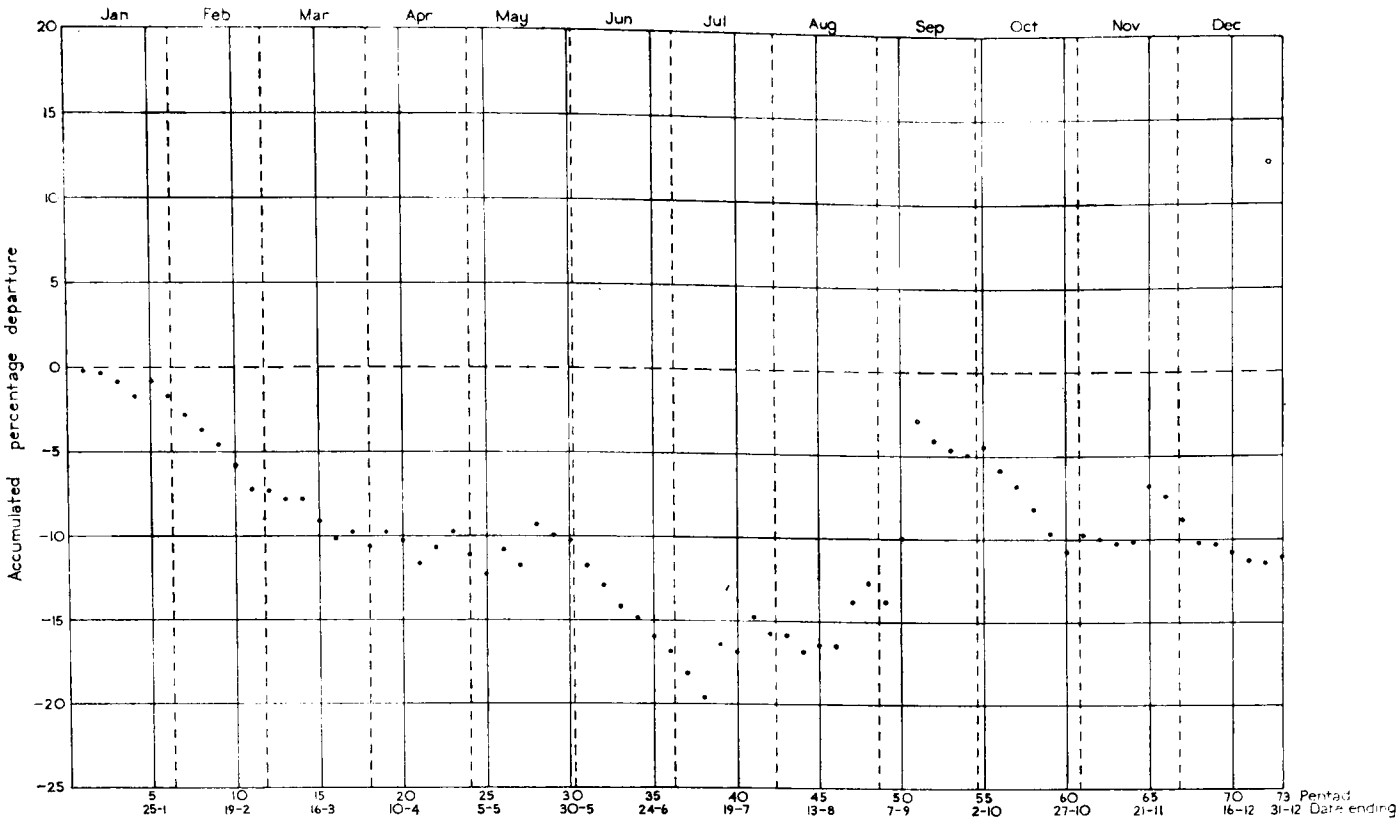
31	7	X		X	31	X		49	X		X		31

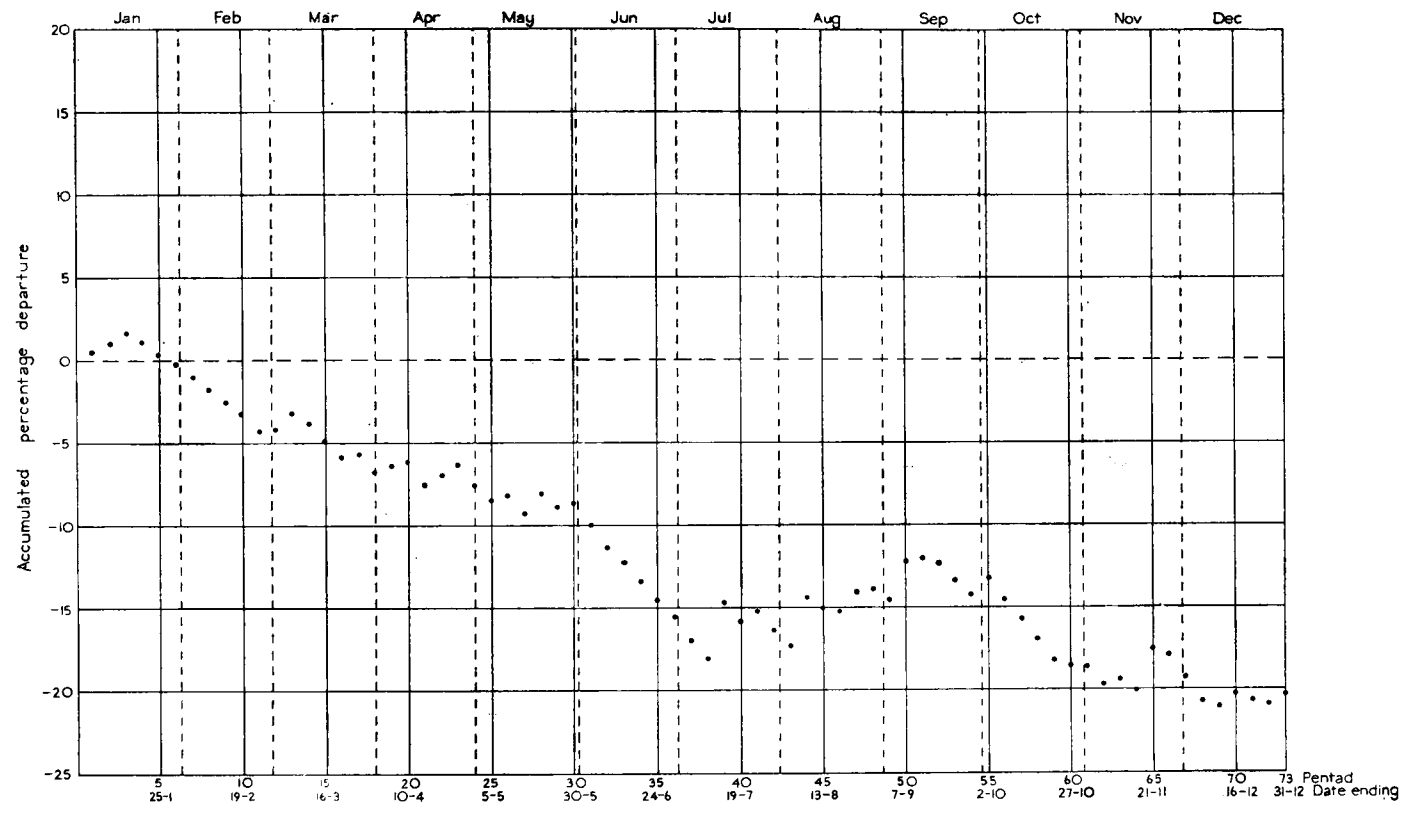
ϕ In the case of a leap year the 29th of February is counted as 28th February, i.e. the total rainfall for both days is credited to the 28th.



Cockle Park

Northumbrian, Coastal
A.a.r. 28·73

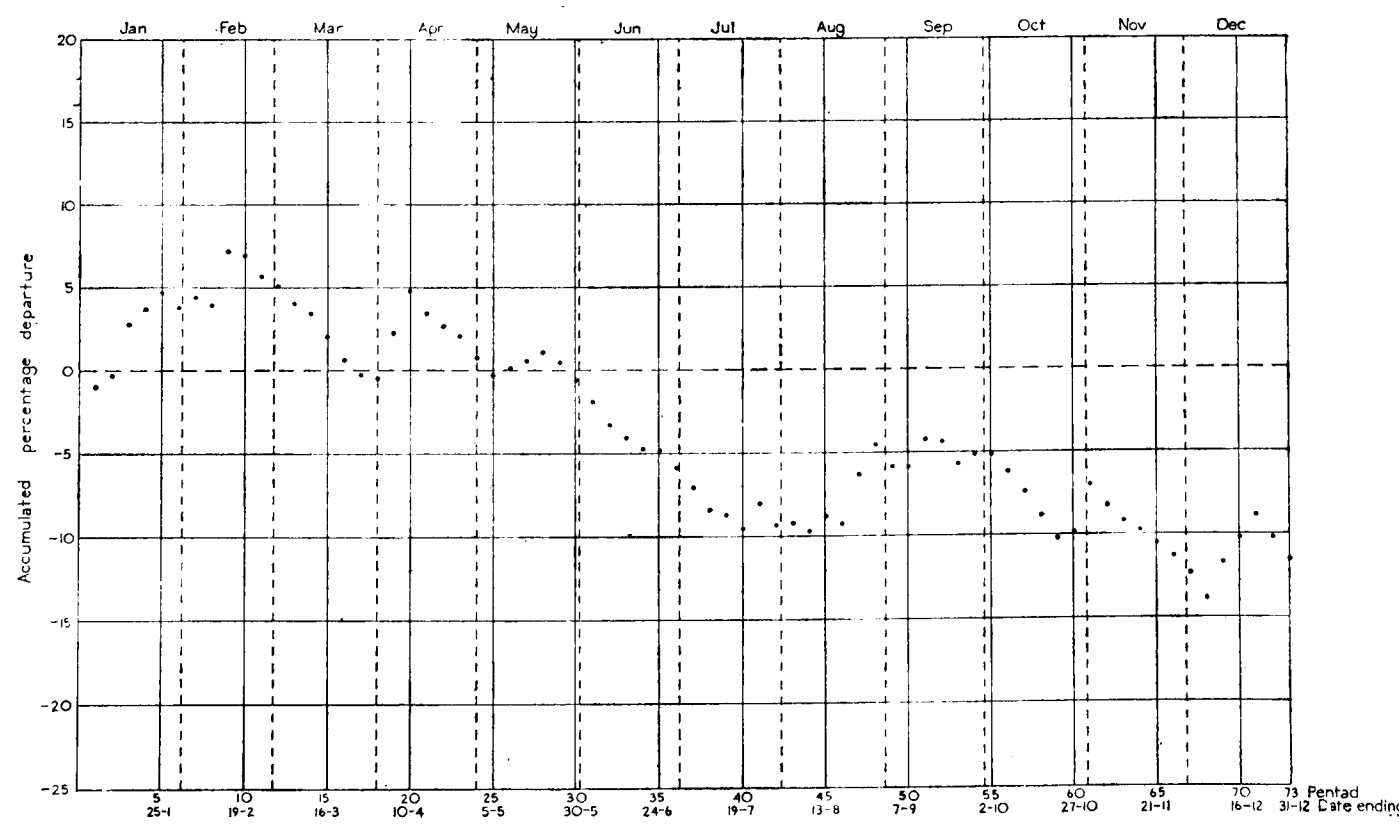
Below average for whole year
·48 in. 42 days from 29·5 to 9·7
Deficiency period 190 days from
1·1 to 9·7



Mulgrave Castle

Yorkshire Ouse and Hull, Coastal
A.a.r. 28·95 in.

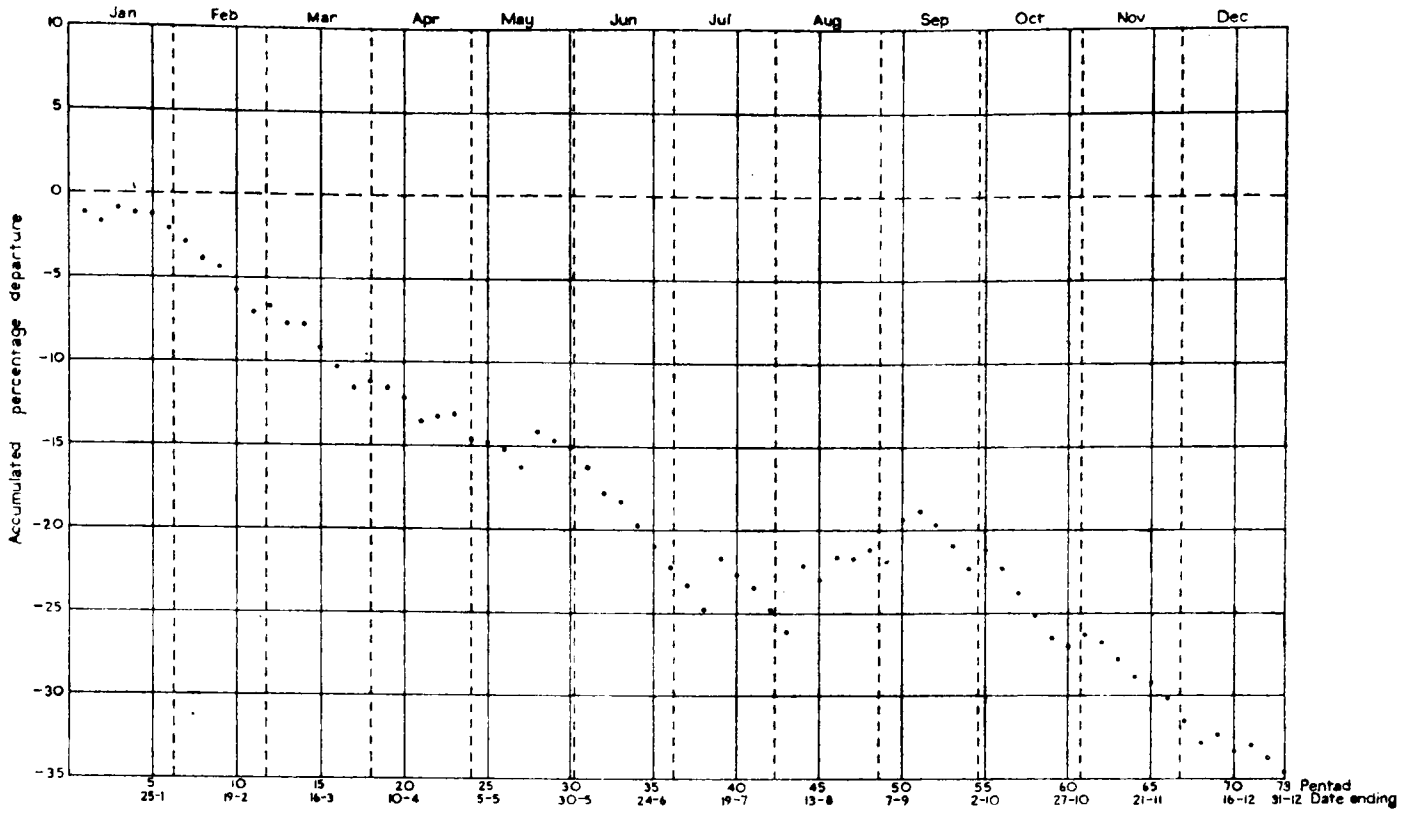
Below average 334 days from
1·2 to 31·12
No rain 14 days from 29·5 to 11·6
Deficiency period 326 days from
16·1 to 7·12



Malham Tarn

Yorkshire Ouse and Hull,
Aire (Ouse)
A.a.r. 60·28 in.

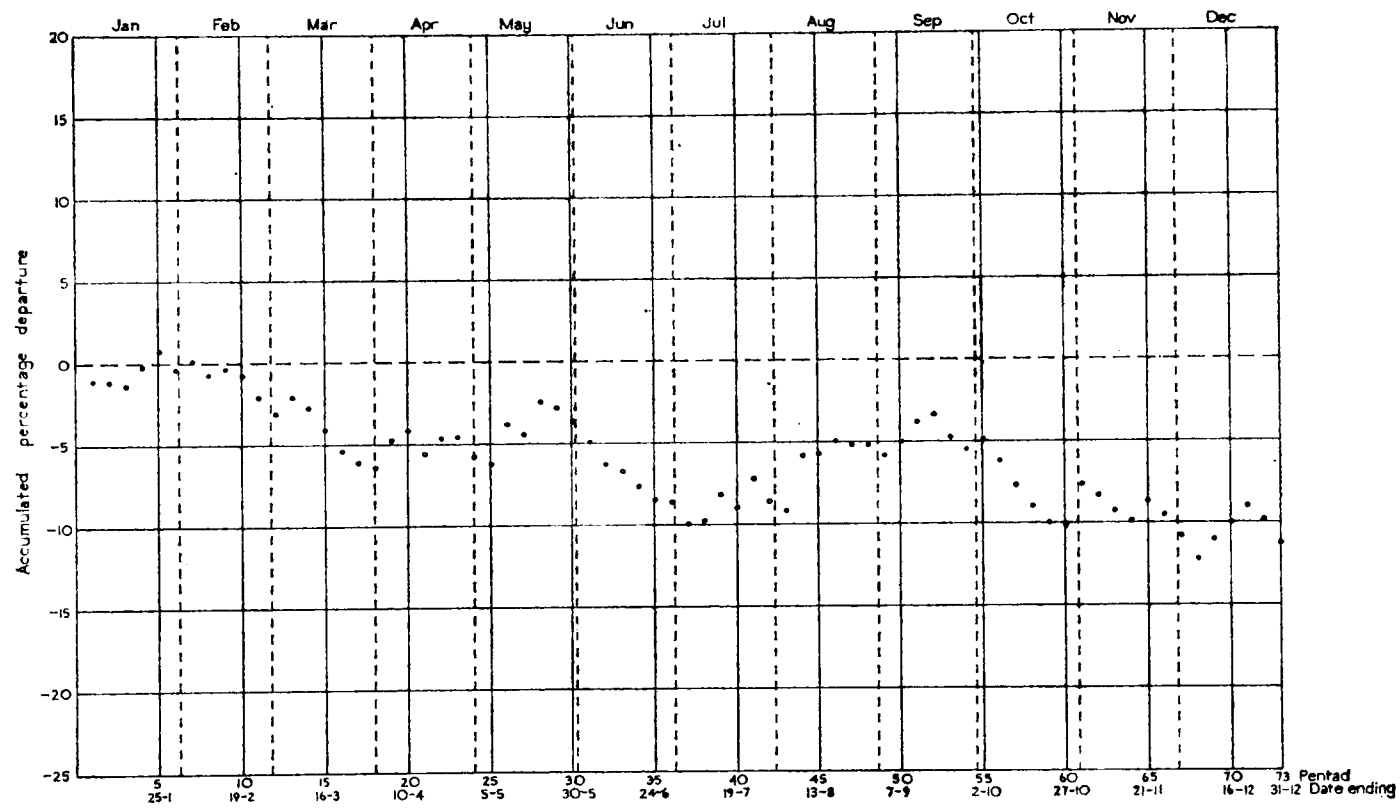
First 5 months above average
No rain 13 days from 22·4 to 4·5
Deficiency period 293 days from
17·2 to 6·12



Wakefield

Yorkshire Ouse and Hull, Calder (Aire)
A.a.r. 26·38 in.

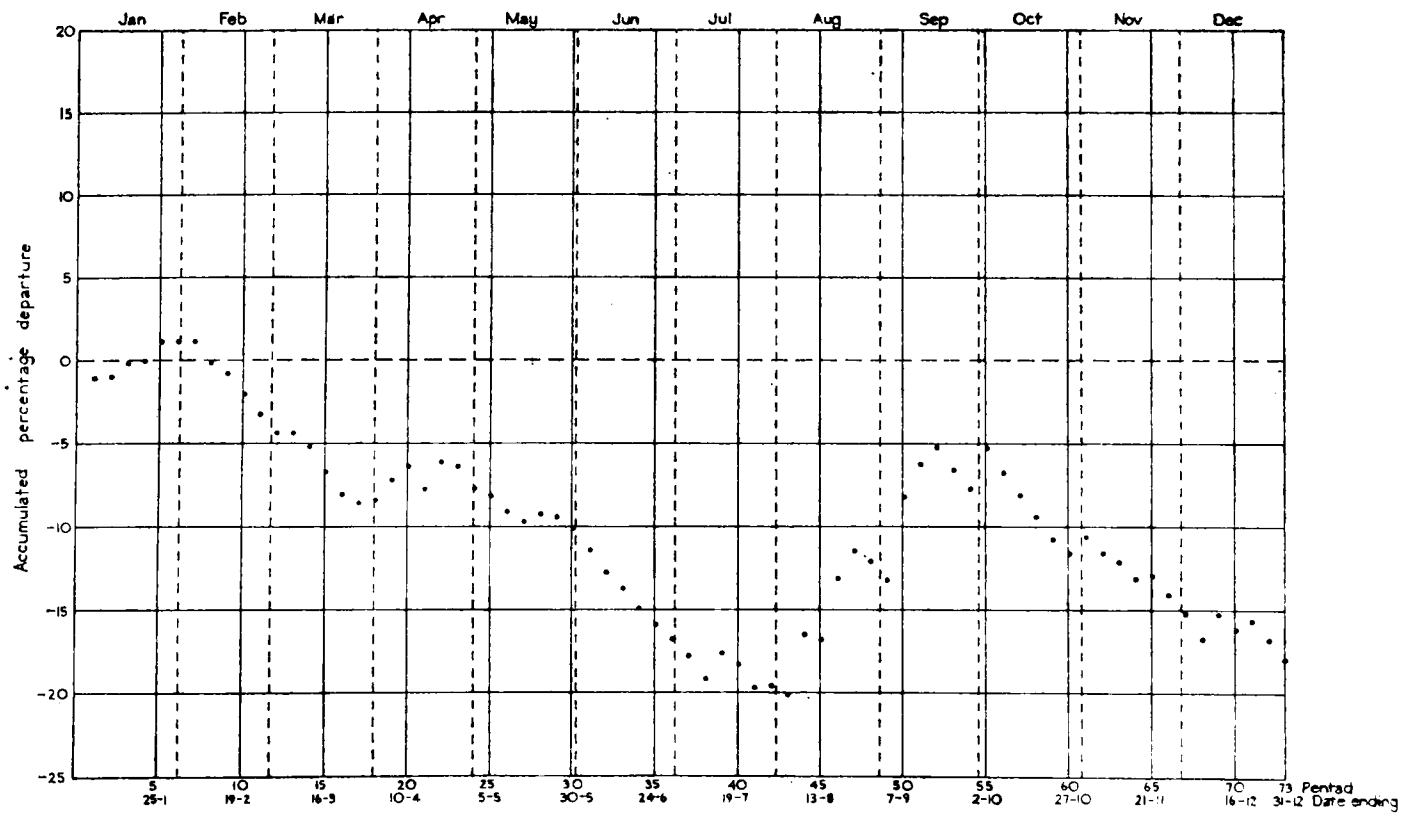
The whole year below average 5·60 in. 159 days from 1·2 to 9·7
Deficiency period 349 days from 17·1 to 31·12



Keele

Trent, Trent
A.a.r. 31·59 in.

·13 in. 24 days from 1·10 to 24·10
Deficiency period 317 days from 25·1 to 7·12



Nanpantan Res.

Trent, Soar (Trent)
A.a.r. 28·13 in.

No rain 20 days from 1·10 to 20·10
·01 in. 24 days from 1·10 to 24·10

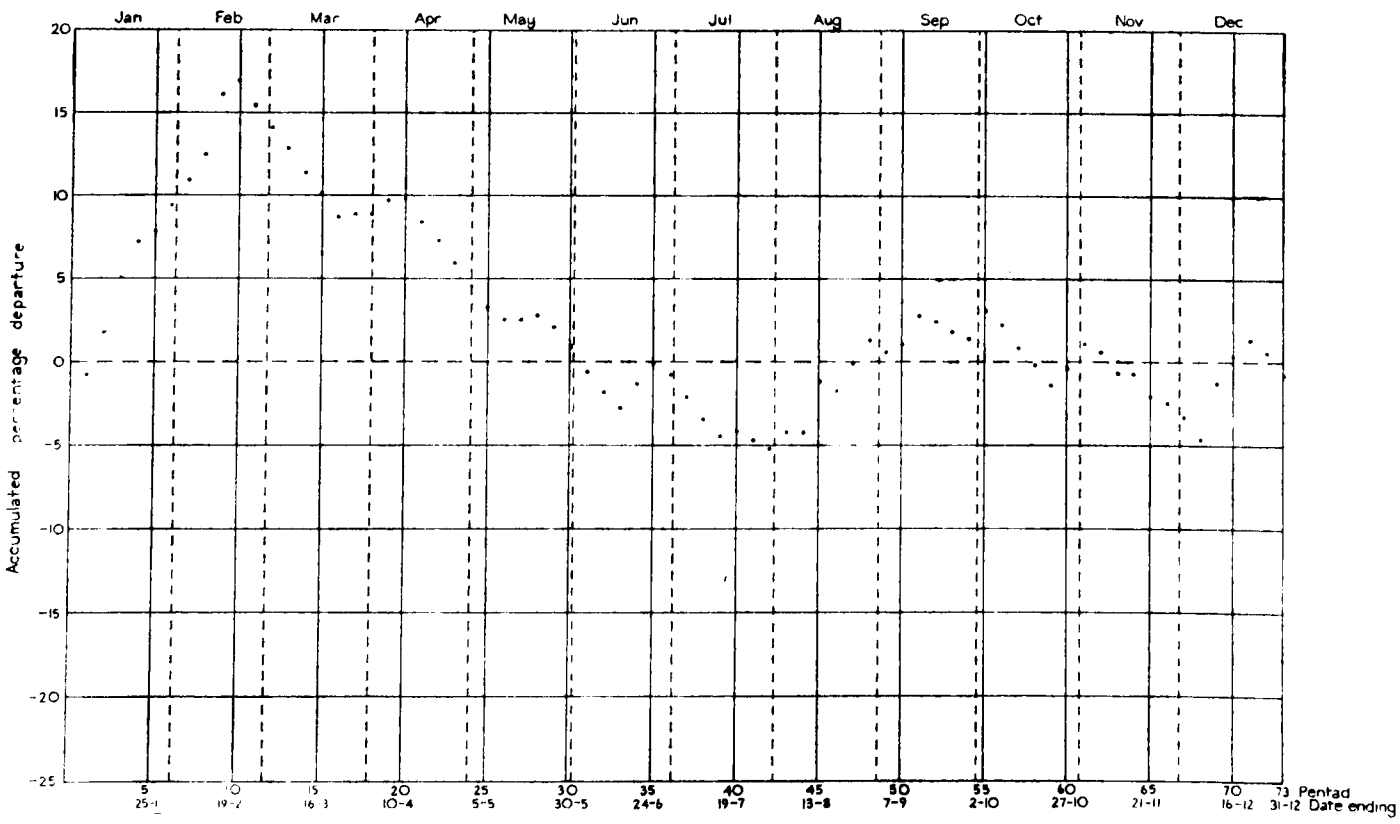
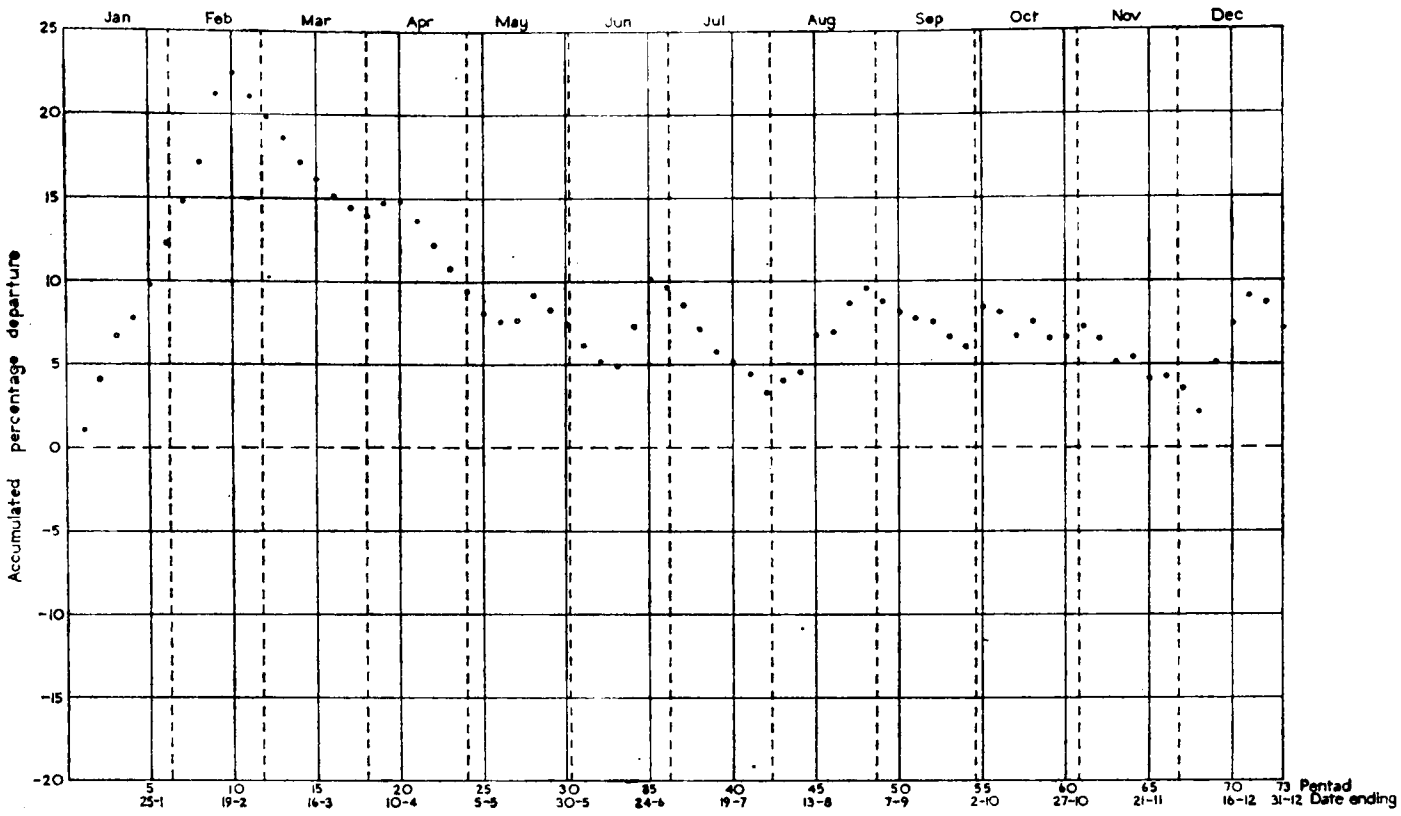
18·7 to 1·10, 22·62 in.



Sloy Power Station

Clyde, Falloch/Leven (Clyde)
A.a.r. 106·27 in.

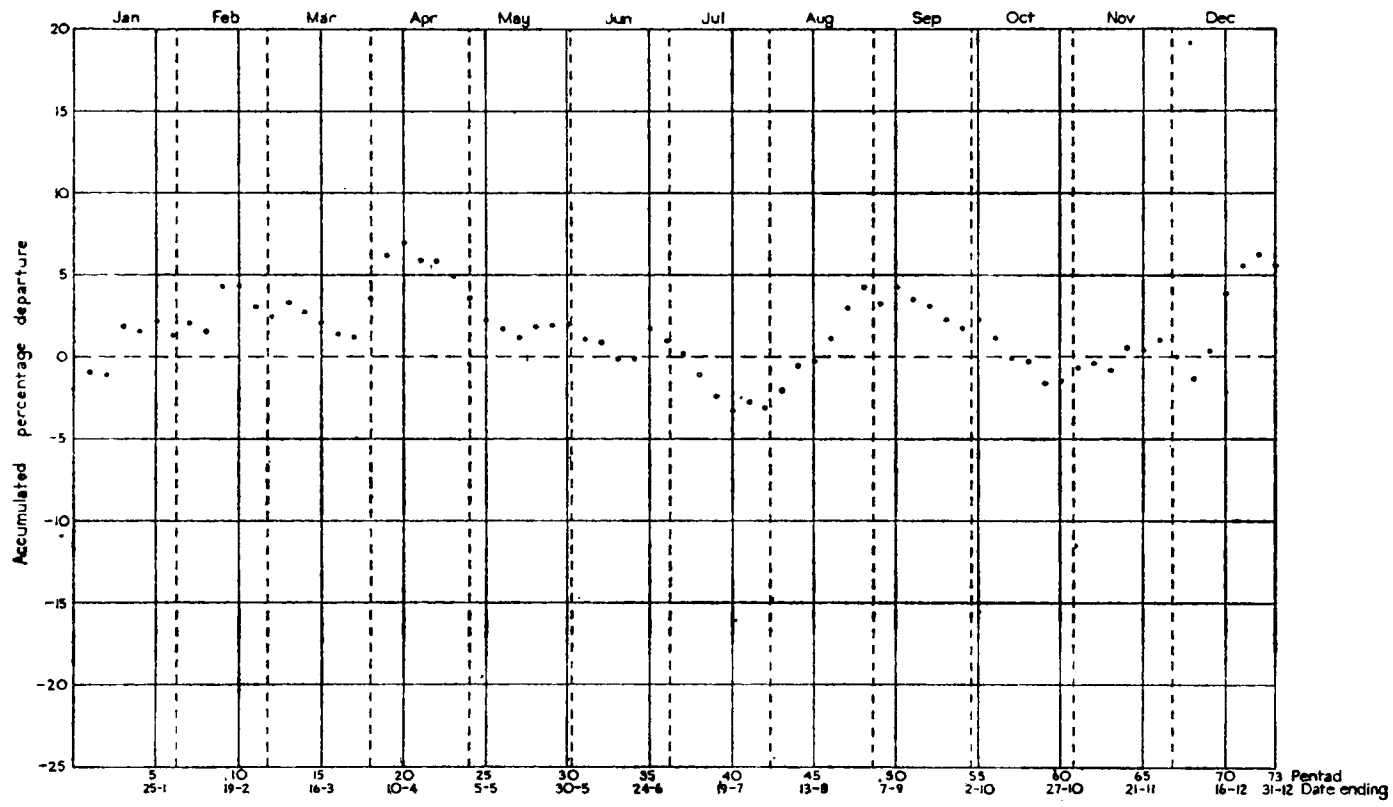
Deficiency period 159 days fro
20·2 to 28·7
Main excess period 47 days fro
4·1 to 19·2, 32·26 in.



Ratagan

Shiel, Alsh and Maree, Coastal
A.a.r. 80·39 in.

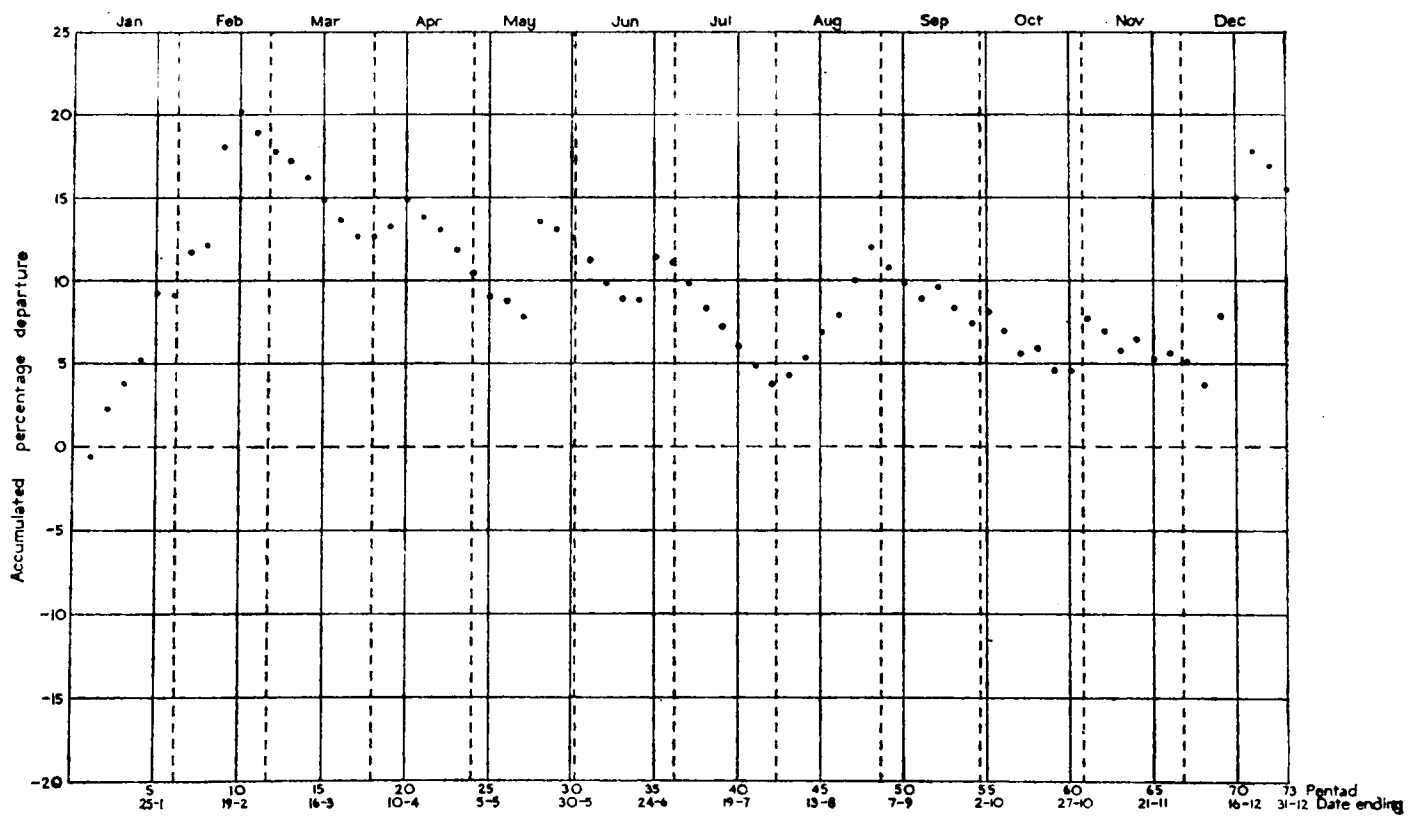
No rain 24 days from 13·4 to 6·5
General deficiency period 290 days from 20·2 to 6·12
Wet period 50 days from 1·1 to 19·2, 29·09 in.
Wettest period 7 days from 18·6 to 24·6, 6·38 in.



Wick

Wick Water to Conon, Wick
A.a.r. 29·97 in.

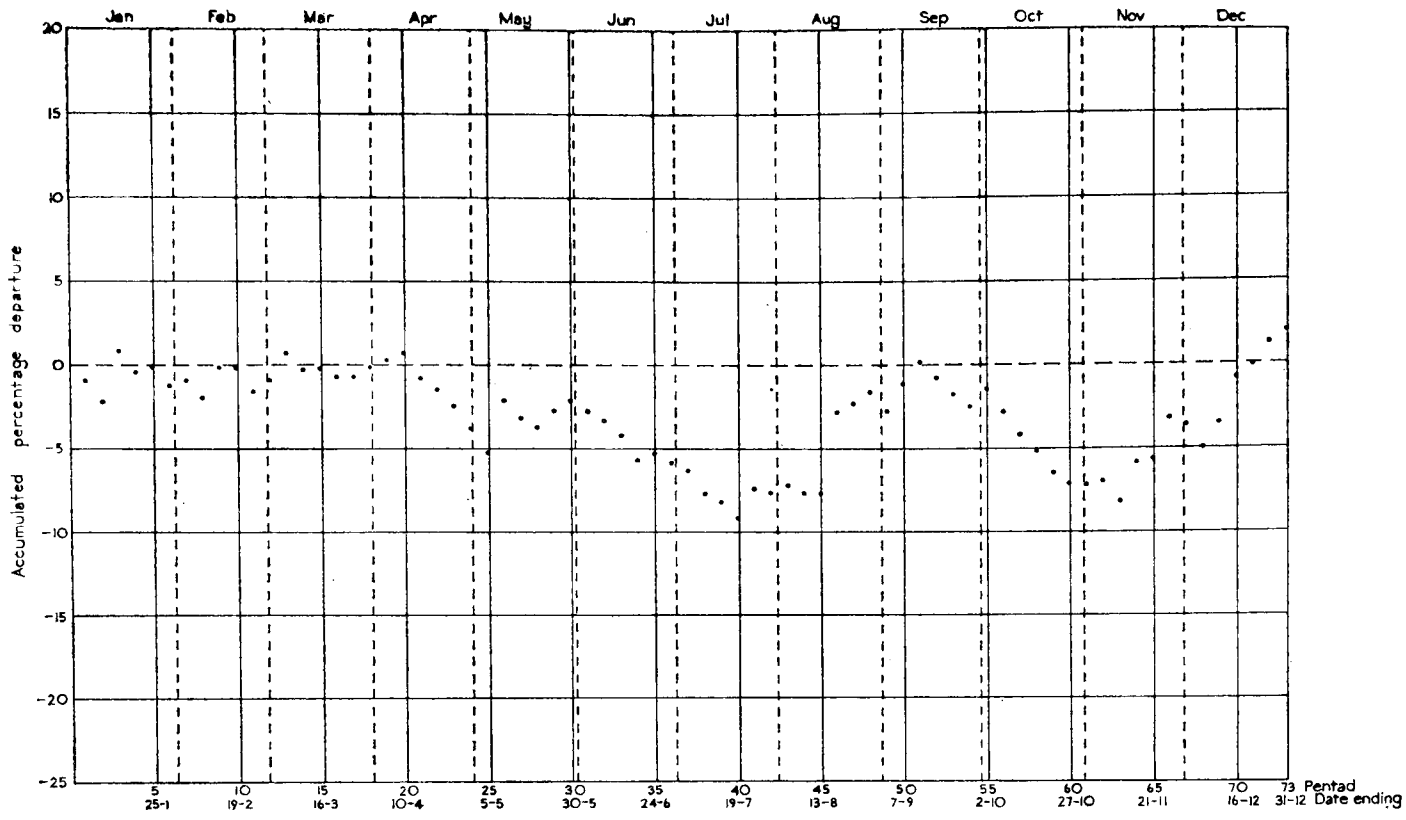
Close to average throughout the year
Main deficiency period 100 days from 12·4 to 20·7



Loch Luichart Manse

Wick Water to Conon, Conon
A.a.r. 44·75 in.

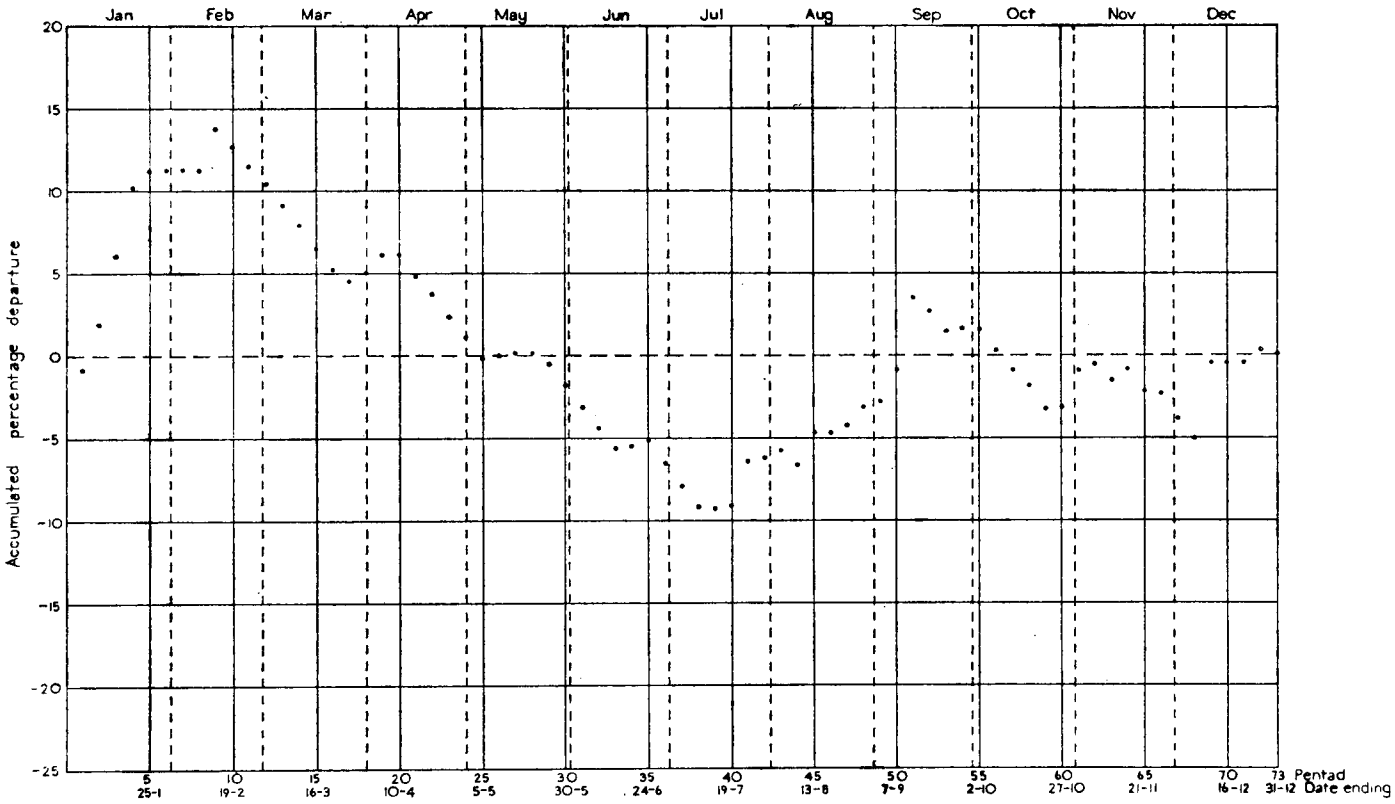
Deficiency period 162 days from 18·2 to 29·7
Major period of excess 44 days from 5·1 to 17·2, 14·90 in.



Gordon Castle

Banff, Moray and Nairn, Spey
A.a.r. 29·57 in.

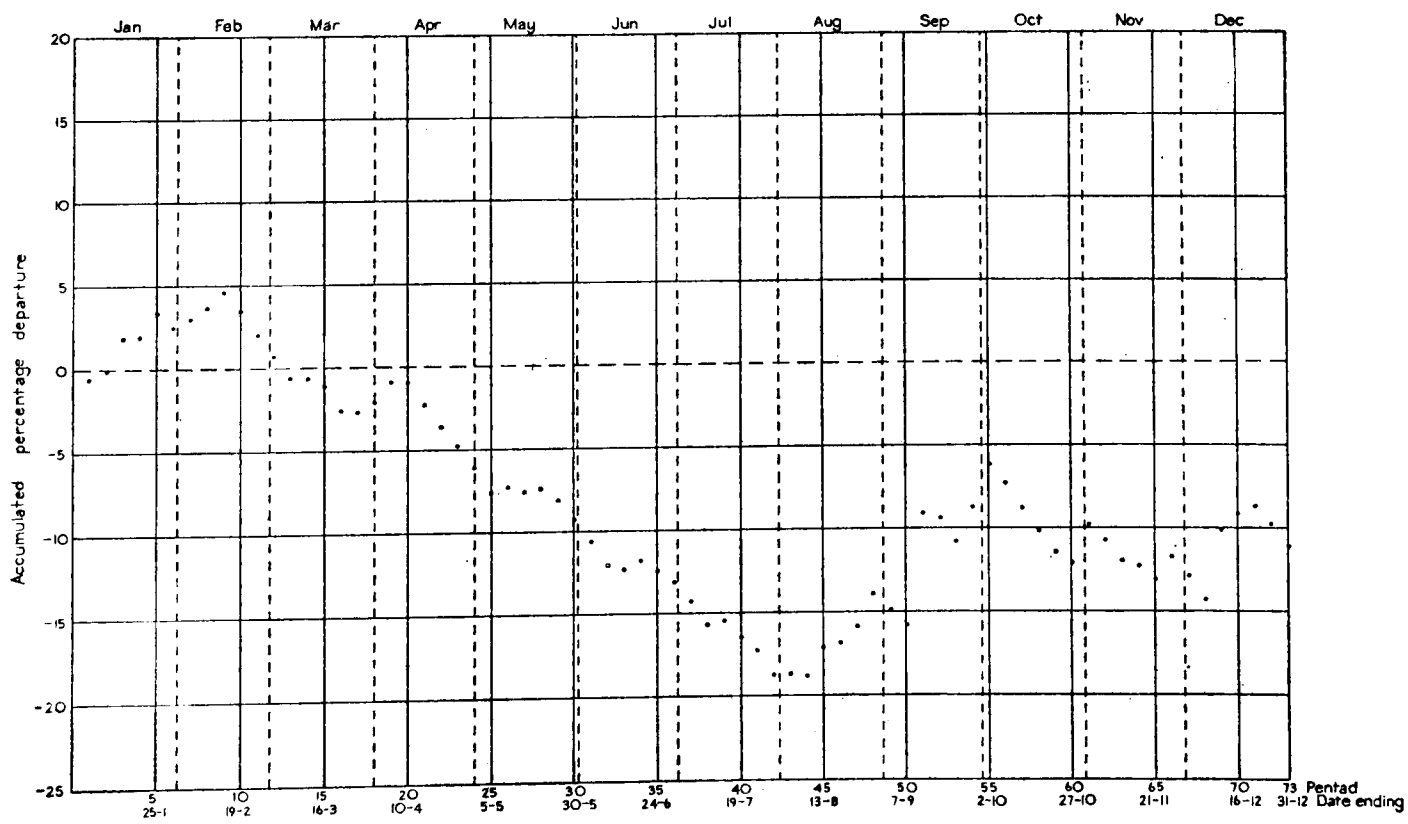
·14 in. 25 days from 30·9 to 24·1(
Main deficiency period 185 days from 16·1 to 19·7



Stirling

Forth, Forth
A.a.r. 38 50 in.

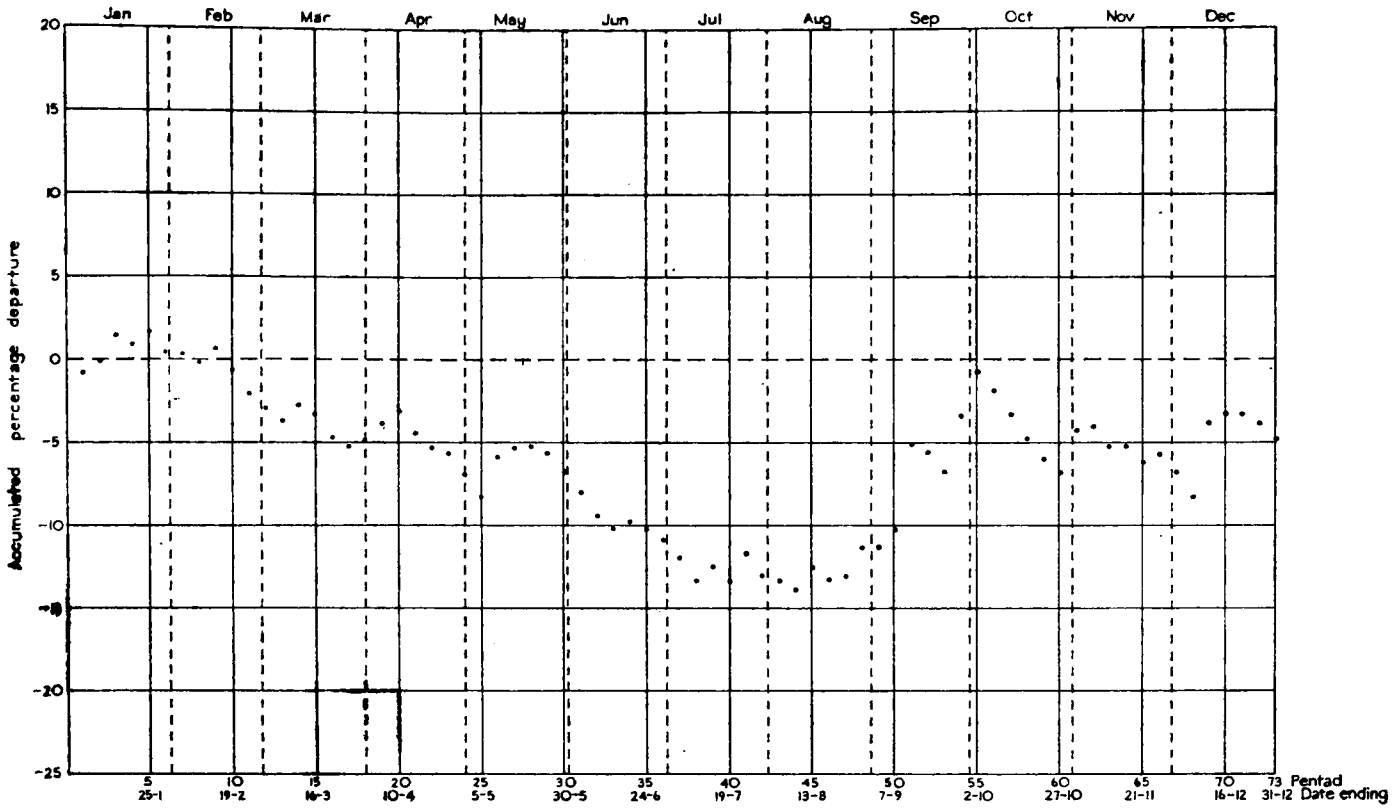
·01 in. 16 days from 24·6 to 9·7
Main deficiency period 248 days from 12·2 to 17·10



Edenfel

Foyle and NW streams (Foyle)
A.a.r. 42·80 in.

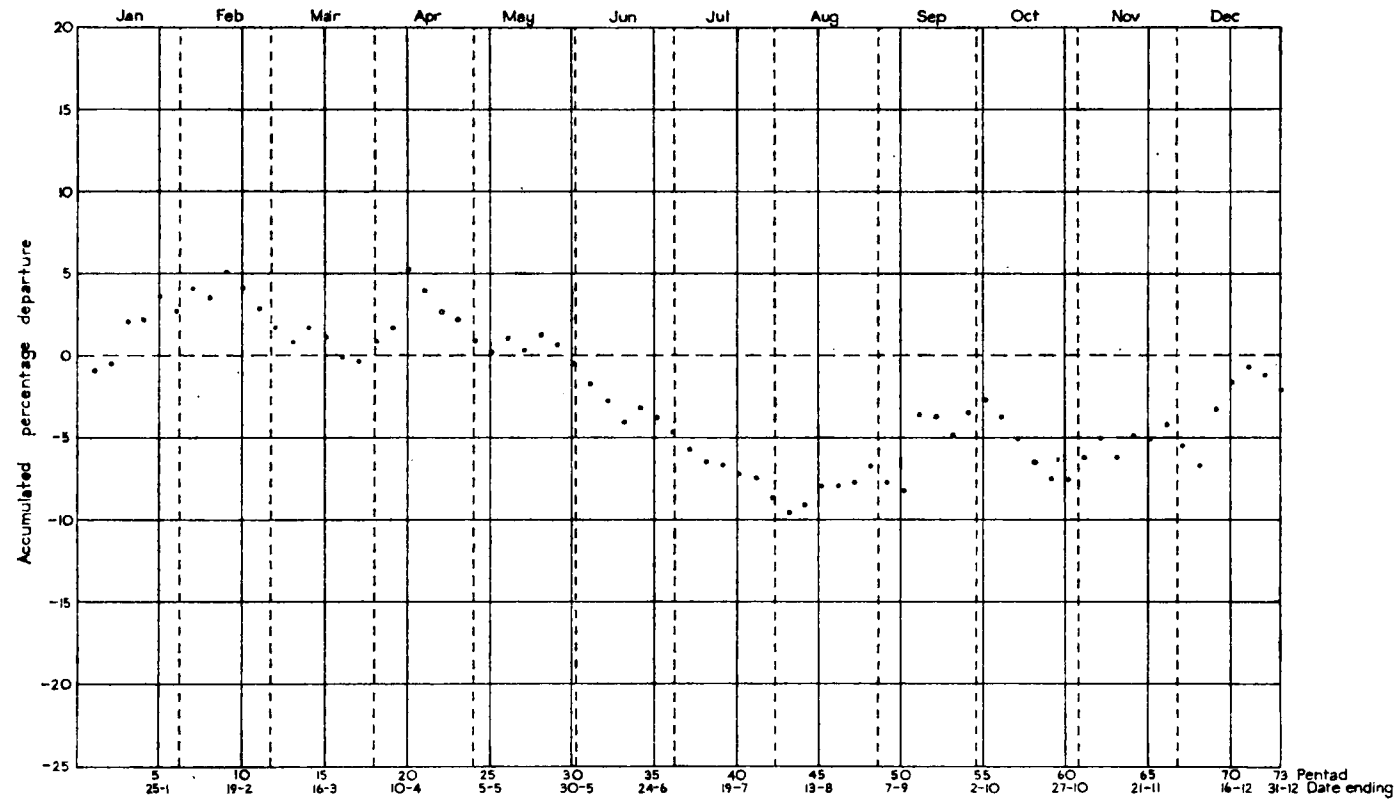
No rain 19 days from 5·10 to 23·10
Deficiency period 173 days from 15·2 to 6·8



Armagh

Bann and Lough Neagh, Callan (Blackwater)
A.a.r. 33·26 in.

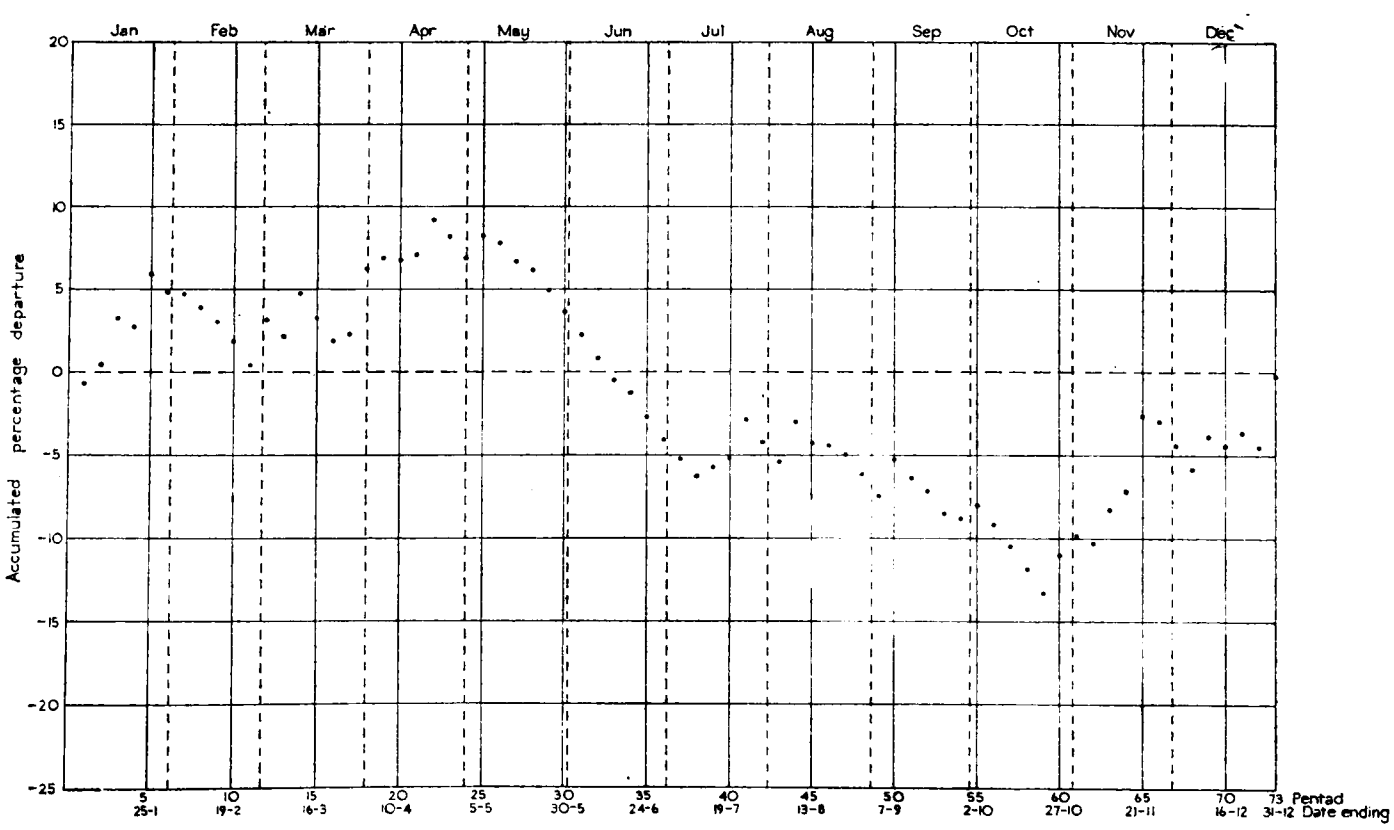
·04 in. 22 days from 5·10 to 26·10
Deficiency period 194 days from 26·1 to 7·8



Coleraine, The Cutts

Bann and Lough Neagh, Bann
A.a.r. 40·89 in.

·07 in. 19 days from 5·10 to 23·10
Deficiency period 170 days from 14·2 to 3·8



Jersey Airport

Channel Islands, Coastal
A.a.r. 32·78 in.

No rain 21 days from 28·5 to 17·6
18 days from 6·10 to 23·10
Deficiency period 185 days from 22·4 to 23·10

4 FREQUENCY DISTRIBUTIONS OF DAILY AMOUNTS OF RAIN

Table 4 gives seven-point frequency distributions of daily amounts for the two seasonal six-month periods and for the calender year. Nine maps are also provided, giving isopleths of the number of rainfall days with 0·04 inch or more for the periods mentioned and similarly for the values 0·10 inch and 0·40 inch. The stations listed in Table 4 are a selection of the many stations used in compiling the data for the maps.

As 0·01 inch is relatively small, the values for this threshold are considered to be more haphazard than for those of the larger amounts. This is mainly due to the difficulties of observing small amounts of rain within narrow percentage limits and partly due to purely meteorological reasons. Also, any conversions from millimetres to inches affect the smoothness of the data where very small amounts are involved. For these reasons it has never been considered really satisfactory to try to map frequencies for those days with 0·01 inch or more. However, with the reservations mentioned the 0·01 inch threshold has been included in Table 4.

Table 4

Frequency distributions of daily amounts

Numbers of days with rainfall amounts reaching or exceeding specified values (in inches)

Area and Station	October 1961–March 1962									April–September 1962									Calendar Year 1962

5 HEAVY FALLS ON RAINFALL DAYS

The systematic tabulation each year of outstanding daily falls dates back to *British Rainfall* 1864, and the present title has been in use since the volume for 1895. However, with the new presentation of *British Rainfall*, 1961 edition, it was decided that summary tables dealing with several years' data would be more appropriately included in the *British Rainfall* supplements.

Adjustments to criteria for inclusion in this section of *British Rainfall* publications were made in 1919 and again in 1961. With effect from the 1962 edition it was considered desirable to modify the criteria so that all falls of 2 inches or more and at least 4 per cent of the annual average rainfall are published in the chronicle. Additional to this, all falls of 4 inches or more are included, irrespective of the percentage value.

An attempt has been made to introduce a means of characterizing rainfall types on the occasions listed in the chronicle by means of brief notes covering in regular order some or all of the following:

predominant wind direction, strength;

type of rainfall, under the headings—depression (rainfall near centre) frontal, orographic or thundery;

direction of movement of front, depression or frontal wave;

type of front—warm, cold, or occlusion.

The broad distinctions between the various types of rainfall can be gauged by considering the falls in relation to locality and season, bearing in mind that generally orographic rainfall is characterized by large amounts but percentage values are not very high and often range from 2 to 5. On the other hand, thunderstorm rainfall has typical percentage values much closer to and sometimes exceeding 10. There is always the likelihood, however, of a combination of the different types of rainfall with the consequent difficulty of deciding objectively the predominant type.

The notes are by no means intended as a substitute for the fuller treatment which may be given in Part III of British Rainfall, or elsewhere, to the really outstanding occasions which usually number only a few each year.

Maps showing the areal distributions of rainfall for ten dates selected from the chronicle follow after Table 5.

Chronicle

TABLE 5

5 January
Winds SW moderate becoming NW light; frontal, orographic; cold front with waves moving rather slowly south-east across Scotland.

Banff Moray and Nairn	in.	%
Farr	2·40	6·3

15 January
Winds S to SW strong; frontal, orographic; warm and cold fronts moving east—vigorous depression in Atlantic.

6 HEAVY FALLS IN SHORT PERIODS

A basis of classification of heavy falls in short periods (ranging from a few minutes to a number of hours) was developed for this country by E. G. Bilham and published in an article "Classification of heavy falls of rain in short periods" in *British Rainfall* 1935. The current position regarding the frequency analysis of intense falls of this type has been discussed in an article by D. J. Holland in Part III of *British Rainfall* 1961.

Details of intense falls on particular dates are obtained either from recording rain-gauges or from appropriate multiple readings of standard non-recording gauges particularly those intended primarily for daily observations.

Table 6A gives the number of days in which specified amounts of rain fell in specified times without reference to the dates on which they occurred.

Table 6B gives the dates with details of known falls which have at least reached the category of 'noteworthy'. Falls are credited to the calender day and not to the 'rainfall day' as is the case in Section 5. Readings from non-recording rain-gauges are referred to in the Table as "eye observations". To augment these eye observations, similar information from recording rain-gauges is listed under "autographic records". The occasions are summarized under the broad categories 'noteworthy' (N), 'remarkable' (R) and 'very rare' (VR) in accordance with the Bilham classification. The information is listed in ascending order according to duration of fall.

Table 6C is supplementary to Table 6B and contains information concerning which there is some doubt either with regard to the magnitude or the duration of fall, or again because the duration is known to have exceeded two hours. The letter "c" against any item indicates that it is in doubt.

TABLE 6A

Frequency Distributions of Intense Falls, 1962

7 EVAPORATION AND PERCOLATION

This section brings together groups of data which have a bearing on the subsequent history of water that reaches the earth's surface as precipitation. These data, derived from measurements of evaporation, percolation and drainage, were discussed in *British Rainfall* 1951 and 1952, particular attention being drawn to the nature of the instruments used and to the limitations of the measurements made.

Evaporation, percolation and potential evapotranspiration were discussed at some length in a group of papers by D. J. Holland, published in Part III of *British Rainfall* 1961 but, as from the present volume, the evaporation tank and the percolation gauge data are returned to a more customary place in Part II with other basic data, whilst F. H. W. Green's irrigated lysimeter data and his comments remain in Part III as a special article.

The presentation of data is generally similar to that in the 1959–60 and earlier editions, but with a few alterations. The 1916–1950 averages, have been replaced by 1956–1962 averages, because averages for the latter period are available for most of the stations. Further, the names of the evaporation stations have been brought into line with their associated rainfall stations. For this reason, the names of some evaporation stations may differ slightly from those used in previous volumes, but as national grid references have been published for a number of years no ambiguity should arise.

In Table 7B the data from 12 percolation gauges stem from 4 stations whilst in Table 7C the data from 5 drainage gauges stem from 2 stations. Both the tables include appropriate rainfall values and also details concerning the gauges in use.

1 POTENTIAL EVAPOTRANSPIRATION DATA, 1962

by F. H. W. Green

Irrigated lysimeter observations have been made at a number of locations in the British Isles for several years. The observational techniques and the use of the observations to determine potential evapotranspiration (PE) were discussed in *British Rainfall* 1958—the first volume of this publication to include potential evapotranspiration data.

Observational difficulties sometimes arise owing to snow drifting, and to flooding. When these, or occasional other causes, have led to short gaps in the monthly returns, values for the gaps have been interpolated, and the total PE for the month has been placed in brackets in the tables. Where the gaps have been too prolonged to permit interpolation, the values have been discarded altogether for the months concerned. It has been attempted to maintain two high level stations, at Coire Dubh in the Isle of Rhum, and at Llyn Llydaw, on the slopes of Snowdon, by weekly visits. The difficulties mentioned above invalidated most months' totals, but some reliable values for certain summer months have been included in the tables. It will be seen by comparison with the neighbouring low level stations in each of these cases that in these two wet west coast areas, PE decreases with height in a way which it appeared not to do in the east (see Tarfside-Upper in the 1961 volume).

A factor which had to be taken into account in 1962 is the so-called 'oasis effect'. This effect raises the apparent PE value when the lysimeter becomes overexposed, through dryness of the surroundings, i.e. when evaporation and transpiration in the surrounding areas has fallen a long way below the potential rate. In arid climates the incidence of this oasis effect is very complicated, but in this country it is largely accounted for by applying a reduction factor based on work by Sutton[1,2] and discussed by Green[3] and Van Eimern[4]. Since the oasis effect does not usually become fully operative suddenly, it is not always easy to determine to which parts of the monthly PE record it should be applied. It is clear that four of the stations were subject to the oasis effect in the summer of 1962, and in these cases the apparent PE values have been marked with an asterisk (*). In the small table (Table 1B), the probable correct values, obtained by using the reduction factor based on Sutton's work, have been given for Overton Down and for Whitehillocks. This has not been done in respect of the other two stations, Rosewarne and Wellesbourne, because of insufficient data. At three of the four stations the soil moisture in the surrounding areas had fallen to such a level that transpiration had become negligible, and the plants in the sward were mostly parched. In the fourth case, Whitehillocks, the lysimeter had to be installed in an area which was bare of vegetation until freshly planted seed had germinated and grown; the soil moisture had not fallen to a level at which water for transpiration would have been inaccessible to grass roots, but it had fallen too low for direct evaporation, and so the oasis effect became operative.

2 SNOW SURVEY OF GREAT BRITAIN

Season 1961–1962

by R. E. Booth

The basic material for this report has been obtained, as in previous years, from returns made by voluntary observers, who have provided month by month daily records of snowfall and of snow-cover within sight of their stations. These records from a network of stations distributed over the country have been augmented by data extracted from the monthly returns of official weather stations and voluntary climatological and rainfall stations reporting to the Meteorological Office. Without the co-operation of all those responsible for voluntary observations, this report could not have been prepared. The measurement of snow depths in the following pages refers in general to observations taken at 0900 G.M.T., or thereabouts.

Summary of the 1961–1962 season

Table I gives, for England and Wales and for Scotland, mean monthly temperatures and differences from the 1921–50 average, the amount of precipitation (rainfall plus rainfall equivalent of melted snow and hail) and the percentage of the 1916–50 average for each month of the whole season, September to May. It shows that the season as a whole was a little on the cold side. Rainfall was average over England and Wales and somewhat above average over Scotland.

Data for ten representative stations* in Great Britain at altitudes between 400 and 1200 ft., which have been used for seasonal comparisons since the survey of 1946–47 give for the 1961–62 season a mean of 29 days with snow-lying at the morning observation. This is 19 days more than the previous season and one day less than the average for the 16 seasons 1946–47 to 1961–62. The 1961–62 mean was the largest since 1955–56, but during the six seasons 1950–51 to 1955–56 only 1953–54 had a smaller mean. The number of days with snow lying in March was greater than during either January or February, usually the months of greatest snowfall.

At altitudes of about 1,000 ft. snow fell on about 70 days in the Cairngorms, in Snowdonia and in the neighbourhood of Lowther Hill, on about 50 days in Sutherland, the Grampians, the Southern Uplands and the northern Pennines, and on about 30 days over ground at this height in most other areas away from the coasts north of a line Barmouth to Bridlington as well as in the neighbourhood of the Brecon Beacons. At stations about 400–800 ft. snow fell on about 30 days in the Yorkshire Wolds, the Chiltern Hills, the Marlborough Downs and the Malvern Hills. At heights below about 300 ft. there were 80–90 days of snow in the Shetlands, 50–60 days in the Orkneys, along the north coast of Scotland and in the Hebrides, 20–30 in Lancashire, the East Riding of Yorkshire and Lincolnshire, and 15–20 days in East Anglia, the London area and along the south coast of England.

The seasonal duration of snow-cover in the mountainous regions of Great Britain is summarized in Table II and illustrated for a selected number of stations in Fig. 2. At lower, levels snow-cover was mainly confined to the months December to March, being observed on about 40 mornings in east Scotland north of the Firth of Forth, on 30 mornings or thereabouts in the Shetlands, Orkneys and Hebrides and along the north coast of Scotland, on 20–30 mornings in north-east England and in the Manchester area,

* Fort Augustus, Braemar, West Linton, Eskdalemuir, Huddersfield (Oakes), Buxton, Luton, Little Rissington, Newton Abbot, Llandrindod Wells.

on 10–20 mornings over most of Lancashire and the Lake District, and over Wales and over central and eastern England between 53°N and 51½N, and on less than 10 mornings over most of the country further south.

Notes on the weather of the months

September. The only wintry precipitation recorded in Britain during the month was some slight snow at Glenmore on the 26th as a cold front crossed the country.

October was a generally mild month, but troughs crossing the country gave a little snow on some of the higher peaks in north Scotland on the 10th and 11th. Following a spell of anticyclonic weather a north-westerly airstream brought occasional snow showers on the 16th to some of the higher ground in Scotland above 800 ft. and a generally northerly wind maintained these showers for another three days; they extended as far south as the higher ground of the North York Moors on the 18th.

November, was sunny and mainly dry with mean temperature below the average; there were cold periods around the 3rd, 10th and 26th. Northerly winds behind an eastward-moving depression brought snow showers to parts of Scotland on the 2nd; in the Monadhliath mountains snow-cover extended down to 1,000 ft. With the approach of a ridge of high pressure from the west the northerly wind and scattered snow showers persisted for another two days extending as far south as the south coast of England on the 3rd; snow lay 2 inches deep at Glenmore Lodge on the 3rd and 4th. The cold front of a depression to the north of Scotland moved eastwards across the country on the 8th bringing some snow to the highest ground in Scotland and North Wales. There were scattered wintry showers during the next three days with winds mainly between north-west and north, but these were chiefly over the high ground in Scotland and snow did not lie below about 2,500 ft. The last cold period of the month was heralded on the 22nd by slight snow showers over the higher ground in Scotland as a trough of low pressure moved across the country. From the 23rd to the 25th the British Isles came within the circulation of a deep depression almost stationary to the east of Iceland. Westerly winds brought frequent snow showers to northern Scotland, and there were scattered wintry showers over the higher ground in northwest England. Level snow lay to a depth of 3 inches in parts of the north-west Highlands even on the lower ground, and ground in this area above 1,000 ft. remained snow-covered until about mid-April. Scattered snow showers continued over the higher ground in Scotland on the 26th and 27th in a northerly airstream behind the low pressure system which was now over Scandinavia and extended southwards on the 28th and 29th over the high ground of northern England as another depression moved eastwards south of Iceland.

December was a cold month particularly during the second half. Snow fell mainly during the first and last nine days of the month; some falls were heavy. During the first week a cold northerly airstream over the Norwegian Sea, between high pressure over Greenland and low over Scandinavia, occasionally spread over the British Isles bringing snow showers to most districts. These were mainly over the higher ground in Scotland on the 1st, but on the 2nd a polar depression skirting north-east Scotland brought considerable snowfall to many northern districts; on the morning of the 3rd snow was 9 inches deep at Glenmore Lodge (1,070 ft.) and 4 inches deep at Malham Tarn (1,300 ft.) in the West Riding of Yorkshire. On the 4th a deepening depression approaching Ireland from the Atlantic brought prolonged snowfall to Scotland and northern England which lay to a depth of 6 inches over much of the Highlands and 1–3 inches further south. Fresh north-westerly winds behind the depression brought wintry showers to most districts on the 5th and these continued on the 6th as a minor trough moved south-east across the country. Snowfall was confined to the higher ground of Scotland on the 7th as a ridge of high pressure moved east across the British Isles. On the 8th wind backed towards south-east as a depression approaching from the Atlantic brought milder weather preceded by snow and sleet in most districts. The mild weather continued until the 13th when there was an exceptionally rapid rise of pressure marking the beginning of a cold foggy period. On the 21st the anticyclone which had been covering the British Isles for nearly a week declined, and from about the 23rd until the end of the month weather was dominated by cold easterly winds with high pressure to the north of the British Isles and low pressure systems moving towards the Bay of Biscay. On most days there was occasional slight snow over the higher ground in Scotland and northern England as well as in eastern coastal districts, the snow being more prolonged on the 28th in the north as a small disturbance moved across Scotland. On the 29th milder air from the Atlantic brought rain to southern England which turned to snow as it moved north, ground becoming snow-covered to a depth of 3–6 inches in parts of the Midlands on the morning of the 30th. On the last day of the month a depression from France moved north-east bringing heavy falls of snow to south-east England; much of the lower ground had 6–12 inches of snow while in the Chilterns level snow lay up to a depth of 15 inches and there were drifts 3 feet deep.

January was sunny but changeable; it was mostly mild except for cold periods at the beginning and towards the end of the month. Snowfall in southern and central England was mostly confined to these periods, but in Scotland there was snow at one place or another every day of the month and the higher ground was snow-covered down to 1,500 ft. in most areas. On the 1st the depression which had given widespread snow on the last day of December moved away to the southern Baltic, and in the northerly

airstream behind it there were occasional snow showers in eastern districts of England and Scotland. From 2nd to 5th a ridge of high pressure extended from the region of the Azores across the British Isles and weather remained mainly dry and cold with unusually severe night frosts. There were, however, scattered snow showers in Scotland and north and east England on the 2nd and isolated showers during the next day or two. The snow cover persisted in most districts until the 6th when a deep depression approaching Iceland brought strong south-westerly winds to all parts of the British Isles with a rapid rise of temperature and widespread rain, which effectively cleared the snow except over the higher ground in Scotland. Winds remained predominantly south-westerly with occasional rain and sleet and snow in the Scottish Highlands until the 11th. On the 12th a deep depression moving eastwards across Scotland brought heavy falls of snow to Scotland and northern England; in north and east Scotland there were drifts up to 5 ft. deep. During the next few days a complex area of low pressure between Scotland and Iceland brought more frequent northwesterly winds and an increase in snow showers to the lower ground of central and northern England; the higher ground became snow-covered again, snow lying to a depth of 1 inch at Malham Tarn (1,300 ft.) in the West Riding of Yorkshire on the 12th–16th and 3 inches deep at Moor House (1,825 ft.) in Westmorland on the 14th and 15th. There were scattered snow showers in Scotland and northern England on the 18th, but the next few days were quieter with sunny periods alternating with belts of frontal rain. A deepening depression brought heavy rain and gales to most districts on the 21st, and there were thundery showers of sleet or snow in most northern districts behind it on the 22nd. On the 29th an anticyclone over Scandinavia intensified and an easterly airstream spread over the British Isles bringing scattered snow showers to east coast districts. The showers extended to most central and southern districts the next day, but a milder south-westerly airstream brought overnight snow to most districts south-east of a line Spurn Head to Portland Bill, which lay to depths of up to 3 inches on the morning of the 31st, but it nearly all melted during the day.

February was mostly mild but there were cold periods on the 13th–15th and during the last week of the month. In Scotland snow or sleet fell at one place or another during the first 18 and last 6 days of the month; in England and Wales snowfall was rather less frequent and was confined chiefly to the higher ground in the north, except during the cold periods. After a spell of stormy weather northerly winds spread over the whole country on the 13th bringing snow showers to most districts. On the morning of the 14th snow lay 3 inches deep in parts of East Anglia. Wintry showers continued in the north throughout the day with temperatures little above freezing point, but on the 15th warm-front rain, preceded by snow over higher ground, spread over the whole country. By the 17th little snow-cover remained below 1,000 ft., even in Scotland, until the 25th. An anticyclone became centred over Scandinavia on the 21st bringing easterly winds to southern England. Scattered light snow showers fell in east and south-east England on the 23rd and these showers became more frequent and heavier during the next two days and covered most of the country. The easterly winds became fresh or strong on the 26th reaching gale force at times on the east coast, and snow showers became frequent and prolonged in east and south-east England and over high ground. Falls accumulated to a depth of 4–6 inches in parts of Lincolnshire and south-east England on the 27th and 10 inches in parts of north-east England. A depression over northern France gave snow in the Channel Islands, a comparatively rare event; it lay two inches deep on Guernsey and 10 inches deep on Jersey on the morning of the 28th.

March was an unusually cold month with snow at one place or another on most days, falls occasionally being heavy, especially during the first week. Until the 25th weather was predominantly anticyclonic in character and winds mainly from a northerly direction. The last six days were cyclonic and somewhat milder. On the 1st the cold front of a shallow depression in the North Sea brought considerable snowfall to parts of Scotland and northern England; on the morning of the 2nd snow lay 15 inches deep at Haydon Bridge. The front moved south and became slow-moving along the English Channel on the 3rd bringing heavy falls to parts of southern England. Meanwhile snow showers continued behind the front in the north and east with moderate falls in places. On the 3rd and 4th snow lay 6–9 inches deep in parts of northern England and Scotland and 2 feet deep in the Cairngorms. A light northerly airstream maintained scattered snow showers on the 6th. The next development was from the west as weather became temporarily less cold. Fronts associated with a complex low pressure area to the west of Ireland moved north-east bringing rain and gales to Cornwall and sleet and snow to most other districts on the 7th and 8th. There was widespread rain but little sleet or snow except over the higher ground in Scotland on the 9th and 10th, but north to north-easterly winds brought snow showers to many districts during the remainder of the second week. A little frontal sleet and snow fell in western districts on the 15th and on the evening of the 16th but an anticyclone from the North Sea became centred over the country on the 17th and weather remained generally sunny and dry until the 19th when weak frontal belts of occasional rain preceded by snow moved slowly south reaching southern England on the night of the 20th/21st. Another trough moving southwards brought snow and sleet to many districts on the 22nd followed by snow showers in a north-easterly airstream on the 23rd, but the milder south-westerly winds of a depression off Scotland brought widespread rain, preceded by snow in the north, on the 25th. Disturbances from the Atlantic brought snow to northern districts on 28th and 29th followed by snow showers on the last two days of the month.

April was another cold month; day temperatures were mainly below average during the first three weeks but night temperatures, although below average in Scotland, were average or a little above in southern England. Snowfall was mainly confined to the first half of the month. The stormy weather of late March continued during the first week with snow somewhere or other every day. Winds between north and west, associated with a depression in the Norwegian Sea, brought snow and sleet showers to many districts on the 1st, ground becoming snow covered to a depth of 2–3 inches in Scotland and 1–2 inches in parts of northern England and the Midlands. A depression from the Atlantic brought snow to many northern districts on the 2nd but it soon turned to rain, and the rain was followed the next day by snow and sleet showers in a northerly airstream extending to the Midlands. On the 4th a depression moved from west Scotland south-eastwards across northern England to the North Sea. Snow which later turned to rain fell to a depth of 2–3 inches in parts of Scotland and 1 inch locally in northern England. A few scattered snow showers over the higher ground in a north-westerly airstream on the 5th and 6th were followed by milder weather on the 7th with snow mainly confined to the Scottish Highlands. The 8th was the last day of the month with snow over any considerable area; with a depression over the North Sea and a trough of low pressure moving southwards over eastern England there was snow in many eastern and Midland districts and ground became snow-covered to a depth of 3 inches in parts of Yorkshire. There were scattered snow showers in a predominantly northerly airstream in Scotland on the 9th–13th and in northern England on the 9th–10th but falls were light and mainly over the higher ground. On the 14th–16th a ridge of high pressure extended from southern Scandinavia to Scotland and an associated north-east airstream brought scattered snow showers to eastern coastal districts of England.

May, a cool month, was notable for its consistently low daily maximum temperatures after the 10th. Minimum temperatures, however, except during the last week were mainly above average. Snow or sleet fell almost daily in Scotland during the last three weeks, but the falls were slight and of short duration and confined almost entirely to high ground.

Duration of snow cover on British Mountains

Diagrams showing the distribution of snow cover relative to height for 11 areas in the British mountains are given in Fig. I. They are based very largely upon reports received from relevant stations given in Table II in which the heights quoted for various mountain ranges are those of the highest peaks visible from the observing stations. On a small number of occasions it was found necessary to supplement these reports with those from other stations in the same area, although it has not been possible to include the names of these additional stations in the table.
